# 1 - ANALYSIS

## 1.1 - Background to and identification of problem

### 1.1.1 - Elderly and Technology

Today, the world is getting more connected by the internet, as people become reliant on it. For the first time, over 50% of people<sup>1</sup> in the world (and over 80% of the western world) are connected by a single network. Ever since the CEO of IBM stated that the market for personal computers was around 5<sup>2</sup>, people have attempted to prove him wrong with over 250 million sold every year today<sup>3</sup>. And alongside the rise of personal computers, mobiles and tablets are also continuing to expand, reaching an even greater group of people. And yet, the rise of the computer has left a generation behind. Elderly people today are termed the 'generation that tech forgot'<sup>4</sup>, living through a period of great technological advance, but ostracized and isolated by it.

Figure 1: Internet use by age group, 2000 – 2012

Source: Pew Research Center<sup>5</sup>

As you can see from the graph, there is a stark difference between the number of people between the ages of 50 and 64 using the internet as opposed to the number above the age of 65. Yet, that number has increased vastly between 2000 and 2012, both as the demographic moves to include those who were once younger and as the technology became more wide-stream and the elderly attempt to use technology.

Yet, despite the changes in technology, only half the population over 65 use the internet. And this is despite all the major benefits that the internet can have for the elderly, from using Video Messaging

<sup>1</sup> (Internet Live Stats, 2017)

<sup>2</sup> (PCWorld, 2008)

<sup>3</sup> (Fortune, 2017)

<sup>4</sup> (BBC, 2015)

<sup>5</sup> (Madden, 2012)

services such as Skype to connect with relatives to using online diagnosis systems to help to diagnose any medical issues they may have. Yet, this is clearly not for lack of trying. Over 70% of the elderly, according to a recent poll<sup>6</sup>, want to use technology and the internet. In fact, talking to a group of my elderly neighbours, one said ‘most of my friends and I do want to learn how to use technology but it’s very difficult’. Throughout my research, there were clearly two parts of the problem for allowing the elderly to use the internet, the first being teaching and the second being support.

For the elderly and the internet, the first method appears to be well covered, with hundreds of organisations teaching the elderly how to use the internet, having classes in libraries and universities. In fact, according to a recent survey, over 30% of those over the age of 70 are in some form of technology class<sup>7</sup>. And according to most, these are relatively successful as the majority of people appear to appreciate them – a recent AgeUK session I attended had members who mentioned that they had gone from knowing nothing to knowing how to communicate with their family in only a few months.

Yet despite these solutions for the first problem, the second appears harder to solve. From methods such as smaller classes to online forums which can answer questions and solve problems which the elderly are having, there appears to be no single solution. How can the elderly receive personalised technical support?

Problems, as any computer scientist, or indeed anyone who has ever used technology has experienced, is simply a part of the problems associated with using technology in this day and age. Yet, young people today have the instinct to understand how the computers can break, from checking that the power wire is plugged in, to going onto the command line and debugging the wireless adapter of the computer. However, to the elderly, when learning has been shown to become more difficult, the process is far more complicated, as they are forced to consult a list of possible problems, looking at all various possibilities, inevitably excluding the actual problem that exists. It was compared to learning a language by an elderly person I spoke to. It is generally hard to learn effectively when you are older, while trivial if learnt as a child.

This is the purpose of technical support companies, who should be able to easily solve all the various problems that the elderly have. Yet, they are expensive, impersonal and often unreliable. Meanwhile, there is a vast array of people who have the requisite skills to solve problems without even realising it, and would be willing to help, yet don’t. In connecting these two groups, one can solve the second part of the problem for the elderly, therefore helping to allow the tremendous power of the internet to the elderly.

### 1.1.2 - The Millennials

Today, technology is engrained in the youth, as we rely upon Snapchat and Facebook Messenger to talk to friends, while using Wikipedia and the online Encyclopaedia Britannica to write essays for school. Through this, the group is highly technologically savvy. In fact, in a paper by Susan Herring of the Indiana University talks of the ‘technological divide’<sup>8</sup>, where the majority of children, by the age of ten, are more technologically savvy than their parents. Meanwhile, by people of previous

---

<sup>6</sup> (Smith, 2014)

<sup>7</sup> (AgeUK, n.d.)

<sup>8</sup> (Herring, 2008)

generations, the millennials are often thought of as the generation that don't care. They claim that they are the generation that are so addicted to our phones and tablets that we don't look up and see the problems that are being faced by large portions of society. Yet, the statistics fail to back it up, as more people are getting involved in social activism, more people are volunteering to help those in need, the elderly and infirm.

Yet, there is nothing that is currently harnessing the greatest skill of the youth, that they tend to be technologically savvy. When taking an informal survey of a number of my friends, the vast majority indicated that they had been approached by elderly neighbours asking them to help out with fixing a broken computer or tablet. Moreover, they indicated that the neighbours complained that it was a regular occurrence which could easily be fixed if they had a manner of reaching willing technological savvy people who could easily solve their problem.

Even more importantly, they indicated that they would be willing to help their neighbours. While they indicated that they would probably want to be paid for their services, the conversation I had with friends also indicated a genuine interest in helping their elderly neighbours and society in generally, as this could help to create a closer community.

### 1.1.3 – Conclusion

Today, there is a genuine challenge for the elderly, who are already struggling to learn how to use technology, to find good technical support, as existing systems appear to be expensive or ineffective. Meanwhile, there is a genuine group of people, the teenagers, who have the requisite skills to help, and appear eager to do so. By attempting to connect the two groups of people, one can solve two problems in one go, from the problem of how to get the youth more involved in society, to how to ensure that the elderly get the technical support that they need.

## 1.2 – Description of current solutions

### 1.2.1 – Online forums

One of the primary methods for solving any technological problems, for the elderly and the rest of society alike, is through the use of online forums which claim to provide solutions in easy to understand English, as well as containing solutions to almost every problem that has existed. This immediately throws up a problem, as the elderly need to have access to an internet connection. Additionally, they need a certain competency with the internet to be able to effectively search for and locate solutions to the problems.

Yet, even when they locate online forums, there are a number of problems with the systems. The forums can largely be split into two types – professional and amateur. In the professional forums, the authors of answers are largely professionals, often charge for visiting the site and are often run as a side service for companies which deal mostly with other issues – including professional technical support companies. One example of a ‘professional’ technical support forum is [techsupportforum.com](http://techsupportforum.com)<sup>9</sup> – a site where those giving answers are ‘IT professionals’. Yet, these sites are often not comprehensive, only answering a small subset of the possible problems that could occur. In fact, even looking up a basic router not working on [techsupportforum](http://techsupportforum.com) yielded a single answer, suggesting that the software setup was incorrect. They failed to suggest simple, and often more likely,

---

<sup>9</sup> (Tech Support Forum, 2017)

problems such as the router not being connected to power or to the telephone connection. Moreover, despite the best efforts of the authors the answers to problems were often complex and hard to follow without prior knowledge of technology – not providing simple enough instructions into how to solve the problem. This problem is even more prevalent in the second form of online forums, where they are largely community run, with answers being provided by people around the world with varying degrees of knowledge. Examples of these sites include r/techsupport<sup>10</sup> (Reddit), StackExchange<sup>11</sup> and even Yahoo Answers<sup>12</sup>. Though they largely cover every possible problem that one might have, they generally fail to provide answers which are easy to understand for the elderly. Instead the answers are generally intended for people with a certain level of technological ability, certainly not elderly people with little experience of using the internet.

### 1.2.2 - Professional Technical Support

Another possible current method of elderly gaining technical support is through professional services offered by many companies both local and global. They offer a much more personal experience than online forums. The person visiting the elderly person can offer a tailored service, ensuring that the problem gets fixed, as well as educating the elderly person how it has been done. Meanwhile, the personal contact ensures that the elderly person is able to ask all the questions they need to ensure that they understand how to fix similar issues in the future. However, there are also a number of drawbacks in this approach. Firstly, since the tech-support is run like a business, the people are incentivised to ensure that there are a number of problems – therefore not sufficiently showing the elderly how they fixed the problem, instead ensuring that they get repeat business if the problem reappears. In fact, talking to a neighbour who had used a Barnes based small tech support company complained that they charged ‘ridiculous’ amounts without actually fixing the problems that my neighbour had. Even for one problem that they did manage to fix, my neighbour claimed that they declined to explain the problem, instead claiming it was too complex and unworthy of explanation.

The issue of cost is an important issue with professional tech support, as they charge vast fees for services which are generally short and not too complex. I gathered information based on call-out fees and hourly rates for ten companies in the UK to show this was widespread.

Company Name	Location	Call Out Fee	Hourly Rate
HTL London <sup>13</sup>	Central London	£100	£50
IT Guy <sup>14</sup>	West London	£75	£50
Andrew Tsai Technical Support <sup>15</sup>	North London	£25	£70

---

<sup>10</sup> (Reddit, 2017)

<sup>11</sup> (StackExchange, 2017)

<sup>12</sup> (Yahoo, 2017)

<sup>13</sup> (HTL London, n.d.)

<sup>14</sup> (IT Guy, 2017)

<sup>15</sup> (Tsai, 2017)

<b>Mitchell Technologies</b> <sup>16</sup>	<b>Wayne</b>	Birmingham	£30	£50
<b>D-Tech-IT</b> <sup>17</sup>		Liverpool	£0	£50
<b>EverythingTech</b> <sup>18</sup>		Manchester	£60	£60
<b>Grant McGregor</b> <sup>19</sup>		Edinburgh	£50	£65
<b>AVERAGE</b>			<b>£49</b>	<b>£56</b>

*Figure 2: Survey of cost of professional technical support around the country*

---

Meanwhile, in order to show the fact that the youth could help to solve this problem, I conducted an informal poll of ten teenagers who said that they would be interested in helping the elderly in my area, and they all suggested no call out fee, with an average hourly fee they would be willing to work for between £10 and £20.

Finally, it is important to state that it is also often challenging to find people in your area as the vast majority of technically qualified people attempt to join jobs in industry and banks as opposed to offering technical support. Even finding eight companies across the country which offer technical support offered a certain challenge.

### 1.2.3 – Remote Technical Support

While remote technical support can be much cheaper than professional technical support, with no call-out fees and with much lower hourly fees as the people can be located in cheaper parts of the world such as India and China, there are a number of flaws with this system. Firstly, this often would be unable to solve some issues, especially those which are associated with hardware rather than with software. Furthermore, the people are often unable to show how they are solving the problem, as they have limited English skills and even if they are able to talk in English, they have little training or experience talking to the elderly, and so are ineffective at communicating the most salient points, instead puzzling their clients.

Another large issue with remote technical support is the problems associated with scammers, who instead of genuinely solving software problems on a computer can instead use the opportunity to install Trojans and other viruses. This would then allow them to have complete access whenever they want, gaining access to everything from people's accounts as they log onto them on the computer to their webcam. This has led to a number of well-documented cases of identity fraud as the scammers gain enough information to imitate their victims, taking all their money.

### 1.2.4 – Conclusion

Though each of the three current methods of technical support for the elderly have flaws, it is clear that from an ideological perspective the second, professional in-person tech support is by far the best,

---

<sup>16</sup> (Wayne, 2017)

<sup>17</sup> (D-Tech IT, 2017)

<sup>18</sup> (EverythingTech, n.d.)

<sup>19</sup> (McGregor, n.d.)

as the human contact allows the elderly to both learn from the problems as well as have the problems fixed the most effectively. Hence, it would likely be important to ensure that I mostly inherit from that method, though attempting to fix the problems associated with cost and lack of availability of tech support people.

### 1.3 - Identifying prospective end user(s)

From the initial problem, there are clearly two main groups of end-users who will both determine the objectives of the system which must be produced. Hence, it is important to consider them each in turn.

#### 1.3.1 – Elderly

For the elderly part of the system, it was important that the end-user would use technology as well as either be elderly or communicate with the elderly on a daily basis. In the end, I considered the two main possibilities for the main elderly end-user of my product, either a group of my neighbours who I had previously interacted with about the problem or an elderly technology expert. Though by including a group of my neighbours, I could achieve a greater range of opinions than simply one person, the perspective was still largely the same, as people from the same street, attending the same lessons, of a similar age. It was therefore important to seek out a person who had more general experience of the problem who could represent the entire elderly community who were trying to use technology. I therefore contacted a number of charities which give technology lessons to the elderly. I attempted to reach a person who had experience in teaching the elderly, and therefore was aware of the various problems that affected them. In the end, Mrs Gill Wilson, the IT Project Manager of AgeUK Richmond agreed to be the main end-user from the elderly perspective, ensuring that the user experience would be satisfactorily simple for a technologically challenged elderly person to use, while ensuring that it properly solved the problem of tech support for the elderly.

#### 1.3.2 – Teenagers

The other aspect of the system is the teenagers part, where they can use the service to get work, solving technological problems of nearby elderly people. Thereby, it would be important that the system worked well for them, as otherwise few teenagers would signup rendering the system useless. In order to gain a teenager's perspective, I interviewed Philip Fernandes, a technologically savvy eighteen year old at St Paul's School who would be interested in using my system to help those around him.

### 1.4 - Identifying user priorities (interviews)

#### 1.4.1 - Gill Wilson

##### **What are some common problems that the elderly face when using technology?**

A number of the most common problems are problems which would otherwise be obvious to those who had grown up with technology, for example failing to plug in one wire or not double clicking on a shortcut to open the application.

##### **How do most of the elderly currently get tech support?**

While we encourage the people we teach to attempt to find solutions to their problems online, we find that a number of them are forced to seek professional tech support as the online forums are difficult or impossible to understand or they require a certain amount of knowledge to even access.

### **How effective is the professional tech support?**

From talking to some of the people I have taught about their experiences in using tech support that they have got from flyers and posters they see around, they have had very mixed experiences, with some finding that they are very good. Some talk about how they are very attentive, help them solve their problem while teaching them how the problem arose and how to detect and fix it in the future. However, others complain of particularly poor tech support, where they charge exorbitant amounts to spend a long time and not even fix the problem that they were asked to fix.

However, a general problem that I find throughout talking to people is the relative difficulty of getting tech support. Unless they receive a flyer, they are forced to ask around and attempt to find people who can help. In fact, they often are forced to rely upon asking family or neighbours who are often busy or unable to help.

### **Would the elderly be comfortable getting tech support from teenagers?**

I think in many ways the elderly would be more comfortable with teenagers than others, as they often can be the nicest people. I've found in talking to teenage volunteers, that they are among the most enthusiastic people to help out. Especially when the amount of money that stand to gain is minimal (or nothing), only those who want to help will actually do so. Even more so, I think they would be rather effective, they'd probably be able to fix the problems as well as a professional, since the problems are generally rather simple.

I think though, that there is also a certain comfort in professionals, where there are specific references and reviews that they have if the person has been recommended by a friend. If you can emulate that with your system, possibly by getting customers to review the teenager who helps them, I think you could reduce this problem.

### **What is the best way for the elderly to interact with a technological system? (Mobile app, website, phone call, SMS)**

There's a growing trend that people aren't really bothering to learn how to use desktop or laptop computers, instead they are trying to learn how to use a smartphone or tablet. I think that you therefore need to have some mobile interface. Maybe it should just be a website which could be accessed from all devices, but I'd actually recommend mobile apps. They appear to be the easiest for the elderly to use – they have been finding them easier than anything else I've seen.

But, I'd also be aware that if people are having technological issues they may not be being able to use their phones or tablets. It might be worthwhile having an SMS system. Maybe they could send an SMS to a phone number and then automatically a person would be set up to be sent to their house. I think SMS is probably the most reliable thing that most elderly people are relatively happy being able to use, so if you can tap into this then that would be very useful.

### **For the mobile apps, iOS or Android?**

Ideally, both. However, if you had to pick one, I'd go with Android. From talking to people around the area, while lots of people have iPhones, more have android phones. This is becoming especially more significant as there is a boom in cheap Android smartphones, and elderly people are purchasing these devices.

Another advantage of Android would be the immediate compatibility with Android tablets. I think there's, counter to what I would expect, mostly android tablets around the elderly. Things like the Hudl and other cheap Android tablets seem to have been especially popular with the elderly and they seem to be really taking to them. That being said, there are a large number of people with iOS devices, so if you could, I would suggest attempting to make a system to work with both.

**What are the major points that you would suggest in creating a user interface for the system?**

I think the most important thing by a long way is to keep it simple. Think, what do they really need. I mean all they actually need is a list of people, how far away they are and their reviews. Minimise how many screens they need to deal with and simplify each screen is as simple as possible. One piece of advice I once received and have always thought valuable is to always ensure that there are only two paths from any given screen. This ensures it is truly simple enough for anyone to be able to use the system.

Take it for granted that they don't necessarily have the instinct of just trying things so try and make each screen very clear. What should they do to get from one screen to the other?

**With regards to payment, how do you think that the elderly would be most comfortable?**

I know that the teenagers would probably be most comfortable with payment over the internet and going directly to a bank account or something like that, I'd suggest that this would probably not work for the elderly who would anyway be unhappy buying things online, let alone paying some random website.

I'd therefore stick with cash payment, with them paying the teenagers directly. With regards to how much they should get paid, I think the main thing is being as clear and transparent as possible. I don't really think the amount particularly matter, as long as it is cheaper than the competition, though this is not really challenging. I might suggest something like 15-20 pounds per hour, or something like that.

**1.4.2 – Philip Fernandes**

**Have you got any experience helping the elderly in your area with technological issues?**

I have a little experience of helping the elderly, mostly just helping my neighbours when their internet wasn't working. However, I love the fact that your system can help me do it more often – I find that idea very valuable and powerful. I also think that you could potentially have a huge number of people in the teenage group who would be willing to help out, especially if they get paid for their work.

**What are the most important aspects of the system for you?**

I think it's basically a system to manage all the people that are requesting their help and being able to message them and arrange a time when to work. It might actually be helpful to have a calendar, booking like interface for each person so an elderly person could see when I might be free and

request to get support at that point – even if it is that evening. Therefore, being able to have the ability to input when I would be free would be important – as well as other stuff like how far I would be willing to travel.

### **Would you prefer a mobile app or a website?**

I think I would prefer the freedom of having both options available – a website would be useful so I could check the status of things even if I don't have my phone. However, I think a mobile app would be very important. Certain things like messaging people are just more natural on a phone. Also, I carry my phone everywhere, so being able to check on jobs from there would streamline my life.

### **iOS or Android?**

Though I think having both an android and iOS app would be useful, I'd say the android app is the most important. Just from my observations, I've found that not too many techie people have iPhones in my age group, probably because of the cost.

#### **1.4.3 – Elderly neighbours**

With regard to the elderly side of the platform, another important part of the research was talking to a number of my elderly neighbours, who would offer another important perspective towards the problem. As compared to Mrs Wilson, they were more likely to actually use the product, therefore would be able to assess it as a client of the eventual service.

In talking to my elderly neighbours, I largely focused on a few main parts: their use of technology, their problems (and any possible solutions they had attempted to find) and the possible solution to the problem of tech support.

### **Their use of technology**

The answer to the question of how much technology they used varied from just utilised a mobile phone to comfortably accomplishing complex tasks like video editing on a laptop. The interesting commonality was that they were all the most comfortable with mobile devices, with the majority saying they were most comfortable with their phone, followed by tablets. This was another interesting point of interest – that the majority of the people I talked to owned tablets, whether they be cheap Tesco Hudls or Apple iPads. However, this was in no case as a replacement for smartphones.

I also talked in depth about how they had learnt how to use the technology in question. For the majority of people, they said this was largely taught by members of their family, perhaps supplemented by classes run by charities such as AgeUK. They all seemed less than happy about this: a number of the people I talked to seemed to feel that they were annoying their family and would have preferred to use other means, but often found group classes (the type of class mostly offered by charities) to be highly stressful environments which were not conducive to learning.

### **Their experience of technical support**

Only one person had any experience of getting technical support from any source other than family, finding someone from the internet. She however found the experience terrible, saying that she paid vast sums of money for someone to come and flick her router on and off. She felt she had almost been

robbed of the money and though the person who came was kind and courteous, she would not use the same service again.

Everyone else however, said that though they hadn't sought better solutions, the problems of their technology not working was a very common problem, and in fact caused an enormous amount of anxiety. One particularly hyperbolic neighbour said that she was near tears after having spent an entire week trying to figure out how to transfer data from an old phone to a new one. This was an aspect of the problem that I had not considered before – just how large a minor technological problem can play on the mind of the elderly. Therefore, tackling the problem becomes even more important, both for simply fixing the problem and in order to help the mental state of the elderly.

### **The possible solution**

Everyone I talked to seemed very enthusiastic about the possibility of an application which could solve the problem of technical support. They were indeed more overjoyed that they would be helped by teenagers, rather than adults. While one might have thought that this was simply because they were cheaper (I know I would), they also loved the idea of being able to talk to young people in their area, and said they would definitely prefer to use a service which used teenagers over one with adults (even if they were the same cost).

I was generally surprised that most of my neighbours were perfectly comfortable with the idea that the system would generally be run over the internet, as they were comfortable with the idea of using their phones. They even mentioned that even if one would struggle because of their phone not working, or issues such as that, it would be possible for the initial appointment to be booked by a friend who could then tell the teenager instead to help their friend. They also loved the idea of an SMS service which could be used instead of the app. One person made the comment that while she probably wouldn't use it as she would be more comfortable with the application, she could see where others would use it.

I also generally asked my neighbours whether they had any particular advice for how to design my application. The overwhelming comment was that it should be simple. One person commented that she found most applications tried to do far too much, making it just too hard to do something simple. She advised that I attempt to remove as much unnecessary content from the application as possible, instead focusing on the core function – allowing elderly people get technical support from teenagers in their area.

### **1.5 – Android vs iOS**

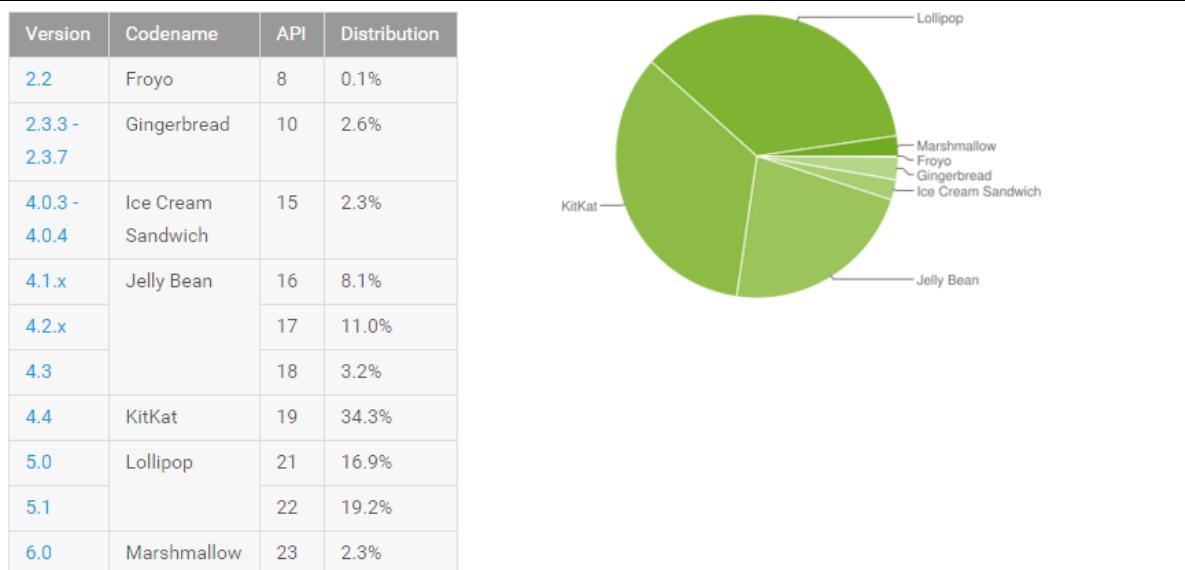

A primary decision in creating the system is considering whether to develop the application specifically for iOS or for Android. Though it could be possible in the future – as the product is rolled out and advertised more specifically, that an iOS application can be created, for now, it has been decided, in conjunction with the discussion with Mrs Wilson to concentrate on an Android application for the elderly.

For the teenagers, the decision was similarly made to focus on Android, after talking to Phil and learning that most of the teenage clients would have Android devices. This is reinforced by research which shows that the majority of children aged below 24 have Android devices<sup>20</sup>.

It was also considered whether a web interface could be used to ensure that everyone, whether they own iOS, Android or own no mobile device, could be developed. However, it was decided that in fact, this is largely unnecessary as the elderly people would find the internet harder to use than an app for their phone. In fact, Mrs Wilson mentioned that today most people are choosing for their first forays into connected devices being phones or tablets, rather than desktops and laptops, as previously.

With the decision made to target Android, it is also important to consider the compatibility of the application produced. As Mrs Wilson mentioned that many of the devices that the elderly are using tend to be cheap, they are likely to use outdated versions of Android software. Therefore, it is important to ensure that the application can work with old versions of software.

**Figure 3: Split of Adndroid Versions**

Data collected during a 7-day period ending on March 7, 2016.

Any versions with less than 0.1% distribution are not shown.

Source: The Official Ionic Blog<sup>21</sup>

However, it is also important to consider that newer APIs also introduce many important features which would make producing the app simpler. For example, only from Android Ice Cream Sandwich onwards (4.0+) is there inbuilt software to help with REST API requests, which is likely to be an important feature of the application. Since over 97% of Android devices would work on an application designed for Android 4.0+, this would be a good version to set as a minimum compatibility version.

## 1.6 – Phones vs Tablets

Another important decision to be made is whether to design the applications specifically for mobiles or tablets. Though Android would automatically make the application compatible with all screen sizes,

<sup>20</sup> (Keating, 2014)

<sup>21</sup> (Max, 2016)

if the application were to be specifically designed for tablets, the UI should be designed for this, taking advantage of the larger screen size.

Since, in fact, a large part of the considerations in designing the UI of the application for the elderly is that it is as simple as possible, containing as little information per screen as entirely necessary, this decision is less important. Therefore, since a greater volume of Android phones exist than Android tablets, it would be better to produce an application specifically for Android phones, with a possible route to expansion being to produce a tablet specific application. Specifically, the UI will be designed to fit best for a 4.7" device, the most common screen size of phones sold today (and incidentally the screen size of my phone, therefore ensuring it is easy to test).

### 1.7 – Payment of helpers

Another important aspect to be considered is how the helpers will be paid for their services. Though Phil mentioned how he would be much happier if the payment were to be done through the apps, Mrs Wilson was very clear that this would be less than acceptable for the elderly. Though it might be possible for a system in the future where a local conduit is paid in cash by the elderly and then the helper would get paid over the app, this adds unnecessary complexity and therefore is unnecessary. Throughout the process, the most important point is to ensure that the system is as simple for the elderly person as possible. Therefore, the payment should happen over cash, directly from the elderly person to the helper.

As per Mrs Wilson's advice, the system should also have a £20 per hour standard rate. Since the people will largely be coming from nearby, they do not need a callout fee and can simply be paid from this hourly rate.

### 1.8 – Acceptable limitations

One important aspect which was ignored for the purposes of the project was the fact that each teenager might have special areas of knowledge, while may not be very competent in others. This was largely because it was largely felt that the project was mostly targeting the trivial problems often faced by the elderly which could be fixed by almost any technology literate teenager, therefore would be unlikely to stretch the skills of the individual. Additionally, reviews could easily cover the specific task that the person did, therefore allowing future elderly people to read that they are competent at that task.

Additionally, the fact that the helper probably has a maximum distance that they would be happy to travel has been omitted for simplicity. Instead, the system will allow a helper to cancel the appointment for any reason, including if they are unwilling to make the long journey. However, the elderly person should be able to see the location of the helper, which would both add a sense of trust, as they would know where they were (and therefore happy that they are not getting scammed) and so they can see how far away the helpers are.

### 1.9 – SMS System

The SMS system, a possible idea mentioned by Mrs Wilson, would allow an entirely separate path by which the helpers could create an appointment with a helper, simply sending a text with information which would allow the system to create an appointment. This would allow elderly people who may not otherwise be able to use the application, in case they are unable to get their devices working for

example, they could still get assistance. This is because SMS is much simpler to use and therefore is likely to be understood by the majority of the elderly people, as they may also be using it to keep in contact with others.

To define this, the amount of data required to be sent by the elderly person needs to be considered. There were a few options, from defining the date, time and helper, to simply sending a text with any content and then the next available appointment would be created. While the former requires too much information, as the elderly person must already know who they want, the latter may be too simple, as the elderly person may not be free at that exact time.

Therefore, a compromise was created, where the SMS system could work off a date and time. If no date is defined, it would default to today's date, assuming that the elderly person wants an appointment as soon as possible.

## 1.10 - Objectives for the proposed system

### 1.10.1 - Elderly System

#### 1. Input

- a. There must be an Android app, which works with all Android phones with software later than Android Ice Cream Sandwich (4.0).
- b. The elderly person should also be able to create an appointment with an SMS messages to a specified phone number.
- c. The SMS should only require the user to send a Date and Time and the information about the appointment should be communicated directly back to the user over SMS.
- d. To log onto the Android application, the system should remember the password of the user once they have logged in once, thereby allowing them to not need to remember the password.

#### 2. User Interface (on all systems)

- a. The screens should be as simple as possible, removing unnecessary information to other screens if necessary.
- b. As a maximum, there should be two possible (very different) paths to follow from every screen, with the difference in what each button does being marked clearly.
- c. All text should be large, above 12pt, to ensure that the elderly person can see it easily, with worse eye-sight.
- d. There should be a screen where the user will be able to scroll through the nearby teenagers who can provide tech support.
- e. This screen should be organised by how near the helper is, therefore meaning that the helper is unlikely to have to travel from very far.
- f. For each teenager, the elderly person should be able to see their average rating (if they have been rated), location and all of their reviews.
- g. The user should be able to look at the various appointments a teenager has free, allowing them to choose a time which would suit them.
- h. They should be able to book an appointment for any available time at least within the next two weeks.
- i. The user should be able to see the list of upcoming and past appointments, seeing the details about the appointment.

- j. For appointments in the past, the user should be able to rate and review the helper, therefore helping future elderly people to decide whether the helper would be able to help them.
- k. For appointments in the future, the user should be able to cancel the appointment, if they are no longer free.

#### **1.10.2 - Teenagers' System**

##### **3. Input**

- a. There must be an Android app through which the person should be able to interact with the system.
- b. There should be a system to ensure to remember the password for the android application, so that they would not have to remember the password every time they log onto the application.

##### **4. User interface**

- a. The user must be able to see everyone who has requested their help.
- b. They should be able to cancel any appointments which they are no longer able to be available for.
- c. The user should also be able to define when they are free for at least the next six weeks, allowing them to set the times that they would be free for appointments.

#### **1.10.3 - General**

- 5. The appointments should be two hours in length for all appointments.
- 6. The payment should be defined as £20 per hour for the appointments, therefore being £20 if the appointment takes up less than half the appointment slot, or £40 otherwise.
- 7. The system should be secure, with passwords hashed to ensure that they are not easy to utilise in case the server is hacked.

#### **1.11 – Explanations for objectives**

##### **1. Input**

- a. In talking to Mrs Wilson, she deemed it important that the system be at least available on both phones and tablets, especially on Android since this is what the majority of the people she worked with used. She importantly stated that this was by far more important than having a web version of the application.
- b. She also said that having a system which would receive SMS messages would be highly useful as most elderly people would be able to send SMS messages. Though it would be possible to insist upon a certain format for the messages to be sent in, it would make for a highly clunky interface. Therefore, if the system could simply interpret whatever the user is attempting to say, this would be optimal. It would also be very important that the system be as compressed as possible, for example removing the ability for the elderly person to choose a helper, instead selecting the person closest to them.
- c. As discussed above, this system offers the optimal compromise between allowing the elderly person flexibility, while still keeping it as simple as possible.
- d. One large issue faced by elderly people is dealing with passwords, especially storing (or remembering) them. Therefore, by ensuring that the system does not require them to remember their passwords to the system, this reduces the problems. This also means that there is no requirement for a 'Forgot my password' system. Though this means that

anyone who is able to unlock the elderly person's phone would be able to book an appointment, it was decided that this would be a worthwhile compromise.

## 2. User Interface (on all systems)

- a. Mrs Wilson was clear that the simplicity per screen was far more important than minimising the number of screens.
- b. She advised two paths from each screen as a maximum, as a guideline to help to reduce the complexity as much as possible.
- c. According to the United Kingdom government, all printed (and digital) materials should use size 12 as a minimum font size<sup>22</sup>. Therefore, this would a worthwhile limit for this application as well.
- d. The ability to view a list of people who would be willing to help is important, so an elderly person can see the helper in more detail including where they are and seeing their reviews and ratings.
- e. Since the maximum distance that a helper is willing to travel has been omitted, this is important to ensure that the likelihood is that even if the elderly person has not specifically attempted to find someone nearby that the person they have chosen (who would be near the top of the list) would be reasonably near.
- f. By seeing the ratings and reviews of a teenager, the elderly person can make sure that the person is reliable and would be able to fix the problem they are having. Additionally, the review may include the nature of the problems they have fixed in the past, indicating whether the teenager has existing knowledge in the area. By being able to see their location, the elderly person can ensure the helper does not have to travel from very far.
- g. Especially in the case where the elderly person is free all day, the ability to simply request the teenager's services is a useful one. However, it would also be important for an elderly person to get an appointment to work with their schedule.
- h. Two weeks ensures that the elderly person can book appointments well in advance, while still offering the opportunity for helpers to ensure their timetable is accurate for that period of time, since they have the ability to change their timetable many weeks ahead of when elderly people are able to book appointments.
- i. This ensures that the elderly person can check all the appointments they made in the past, allowing them to ensure they are around for the next appointment or to cancel it.
- j. Mrs Wilson described how this was important as the people who are helping out are teenagers and not professional, so a number of them may not be very good and a few bad people, if not obvious to the elderly when booking an appointment may ruin the system.
- k. If the problem has been solved, it would likely be no longer necessary for the appointment to occur, therefore the ability to cancel the appointment is an important one.

## 3. Input

- a. Philip and my own research indicated that the majority of technological people use Android phones so iOS can be omitted.
- b. Though less important for the helpers, who would be technologically savvy, this would be a welcome addition.

---

<sup>22</sup> (Department for Work and Pensions, 2014)

#### 4. User interface

- a. This is relatively self-explanatory as the user must be able to see who has requested their services.
  - b. Especially important for the helpers, this ensures that they can cancel an appointment if they are no longer available or if they have been requested by an elderly person who is outside of the radius which the teenager would be willing to travel within.
  - c. The teenager may have an often-changing timetable of when they are free therefore it would be important that they can easily adjust this timetable.
5. This length was decided in conjunction with Mrs Wilson, who said this was the maximum time which an appointment would take. This fixed length of appointment also simplifies the system, ensuring the person can only book appointments at set (even hour) times.
6. This was decided in section 1.7.
7. Though it would be highly advisable (and this could be mentioned on the application) that passwords should not be reused, and therefore it shouldn't matter if passwords for this system were stolen, it is likely that not everyone would follow this advice. Therefore, it would be important that passwords are stored securely, hashed in the database and never transmitted unencrypted over a network, in order to make it harder for them to be stolen.

#### 1.12 - Safeguarding

Throughout the conversation with Mrs Wilson and a number of other elderly people, there was another issue which was often raised. This was the issue of safeguarding and insurance, in case there is damage which is caused by the helpers, or if the helpers are assaulted or encounter other issues. Mrs Wilson talked about how even when AgeUK sent adults to help others (for plumbing and suchlike), they had to be insured to ensure that if there were any problems that AgeUK were not liable for the costs in fixing anything.

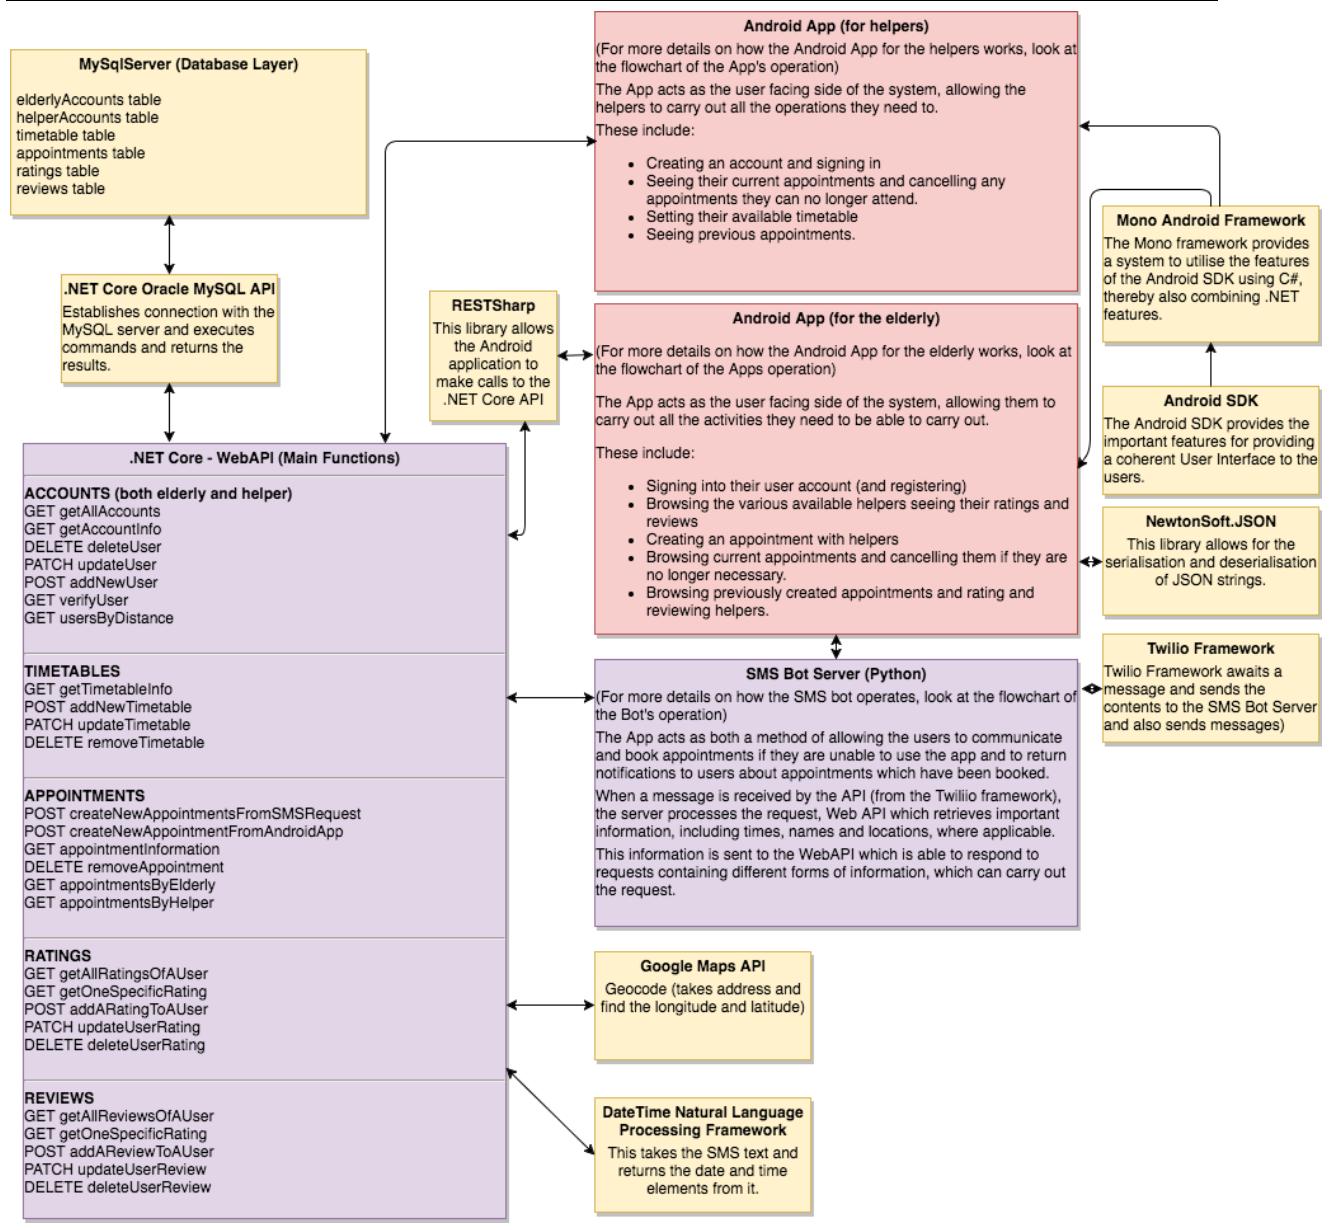

She also suggested that things would be even more complex for my idea, as I would be sending untrained children. This could require everything from DBS (and other criminal) checks to more costly insurance.

With more research, the legality of my system seems to be hard to define and the system may require anything from large scale insurance to simply adding a statement when a helper registers that I would have no liability in whatever happens at the meeting. Instead, this liability would be squarely distributed amongst the helper and the elderly person. However, this issue would require further investigation and hence is being ignored for the purposes of this coursework project.

## 2 – Design

### 2.0 - Overview of entire system

Figure 4: Diagram of Entire System Design

Source: Designed using draw.io<sup>23</sup>

### 2.1 - Introduction

In designing the solution to the problem, much attention was paid to centralizing as much as possible of the system, both for reliability and security and to ensure that the minimal amounts of coding as possible could be done on the applications side. This ensures that the applications will be fast to run, as well as being easier to produce. Hence, the solution relies upon a server which will respond to requests to return information which can then be interpreted by the application.

<sup>23</sup> (Draw.io, 2017)

While creating the user interface, I spent more time with my end user for the elderly specifying how I could specifically design the user interface to be as easy to use as possible, discussing everything from the sizes of button to the colours which would be the most obvious.

## 2.2 - Data

### 2.2.1 - Storing Data

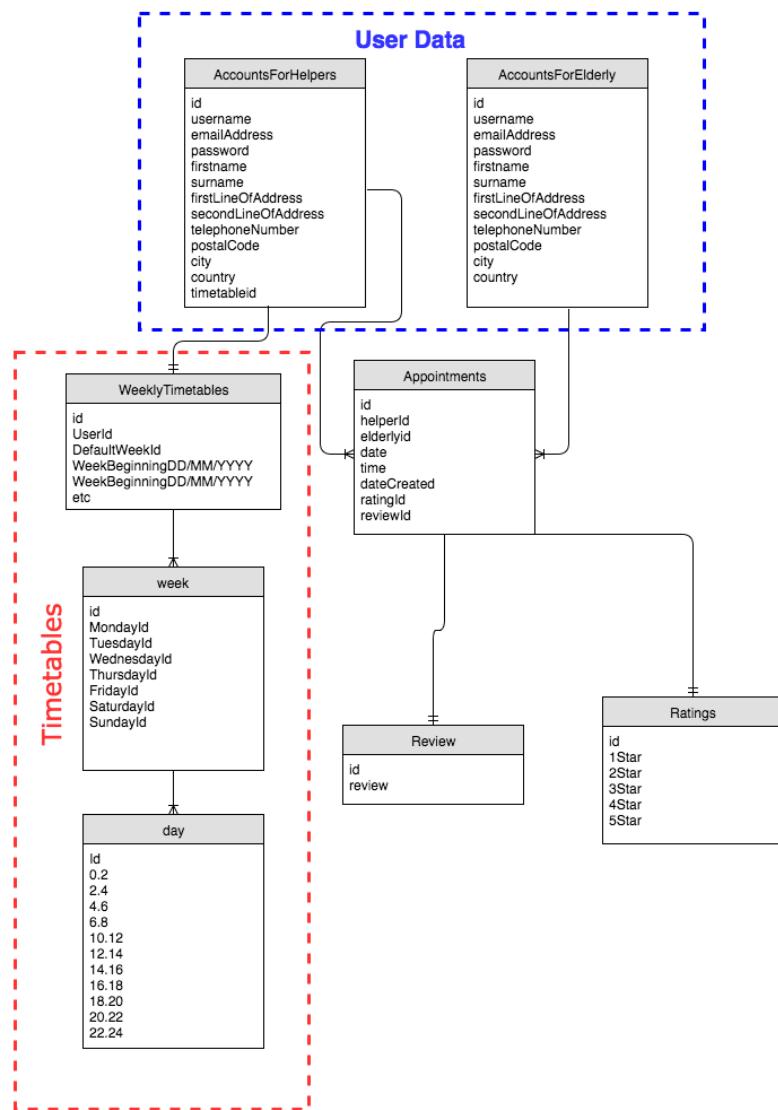

Since all the data had to be accessible from all the various application, on all devices, the data had to be stored centrally. Therefore, I decided to use a centralised server which could act as a hub for the data, with the data being retrieved from it when necessary.

While I considered some databases such as MariaDB, I decided that the MySQL packages by Oracle provided the most secure features, while having acceptable documentation for the syntax of SQL commands. Additionally, as compared to Microsoft SQL Server, it could easily run on an Ubuntu 14.04 server that I already had access to, as it was already being used as an Apache Web Server.

In considering what data would be required to be stored, I went through the specification that I created and considered where the data would be needed to be stored. Starting from a general number of tables, I began to draw out the connections between the tables of data, ensuring that I got the database into third normal form, to ensure that the data would be stored most efficiently.

### *User Data*

Though the accounts for helpers and accounts for the elderly could easily be combined together, this would create a relationship between appointments and the accounts table which would not be desired. Therefore, separating these two ensures that the relationship is One-Many and is as efficient as possible. Additionally, this ensures that if in the future, more or less information is desired from one of the groups, then this could be easily adjusted without affecting the other group.

However, mostly the same information is being stored about both parties with the exception of the inclusion of a timetable id for the helpers.

Hence, we can consider them together for now.

Name	Variable Type	Description
<b>id</b>	Int	This is the key for the table, acting as the counter. This auto-increments every time a new user is added to the table – using this function when creating the MySQL table.
<b>emailAddress</b>	Varchar(50)	The email address acts as part of the contact information provided to both parties when an appointment is set up. It is also used as the piece of information which is used to login. This ensures that there is no additional username which is required to be memorised.
<b>password</b>	Varchar(50)	The password contains information (though hashed) of the password which the user needs to use to access the application and connect them to their account information.
<b>firstname</b>	Varchar(25)	Contains the user's firstname.
<b>surname</b>	Varchar(25)	Contains the user's surname.
<b>firstLineOfAddress</b>	Varchar(100)	Contains the user's first line of the address.

<b>secondLineOfAddress</b>	Varchar(100)	Contains the user's second line of their address. Optional piece of information, as some people do not require it to describe their location.
<b>telephoneNumber</b>	Varchar(100)	Contains the user's telephone number.
<b>postalCode</b>	Varchar(25)	Contains the user's postcode.
<b>City</b>	Varchar(25)	Contains the user's city.
<b>Country</b>	Varchar(35)	Contains the user's country.
<b>timetableId</b>	<i>Int</i>	<i>In the case of the helpers database, this contains the id of the weeklyTimetables database which contains information of the timetable.</i>

Figure 7: Example of data from 'AccountForHelpers' database

<b>id</b>	<b>username</b>	<b>emailAddress</b>	<b>password</b>	<b>firstname</b>	<b>surname</b>	<b>firstnameOfAddress</b>	<b>secondlineOfAddress</b>	<b>telephoneNumber</b>	<b>postalCode</b>	<b>city</b>	<b>country</b>	<b>timetableId</b>

### Timetables

While the timetables table could theoretically be combined with the main user's database for the helpers, by separating these two tables, the system is marginally more clear and easier to work with.

The timetable system itself is separated into a few different tables. The first consists of a table with multiple columns, each corresponding to a week of the calendar (referred to by the Monday date of the week). There is also a default calendar which is used for all weeks which are not otherwise referred to specifically by a column. When an appointment is created, the timetable must be altered to make that time on that day no longer be free. If the week is already referred to by a column (there has been another appointment by anybody during that week), then the entry of the week can simply be changed. Otherwise, the column is created, and every other entry has a clone of their default week added in that column.

Each entry, in each column has an entry which refers to an entry in the weeks table, which contains the specific ids of the days to which the week refers. Finally, in the day table, the specific

<sup>26</sup> (SequelPro, n.d.)

information about the day in question is stored, with details about each two hours slot and the person's availability at this time.

Name	Variable Type	Description
<b>Id</b>	Int	This is the key of the table, and auto increments whenever a new entry is added.
<b>defaultWeekId</b>	Int	This contains the id of the default week which is created when the user first signs up to an account.
<b>DD_MM_YYYY (i.e. Week Beginning DD/MM/YYYY)</b>	int	<p>There may be n columns of this, where each column contains either a null, if this entry simply uses their default timetable for this week, or contains an id for another week entry linking to the week table.</p> <p>Whenever a new column is added, a check is run whether the DD/MM/YYYY is in the past, and whether it can therefore be deleted. This ensures that the data remains reasonably small and cannot threaten to break the server.</p>

**Figure 8: Example of data from the ‘Timetable’ database**

<b>id</b>	<b>defaultWeek</b>	<b>13_03_2017</b>	<b>06_03_2017</b>	<b>27_03_2017</b>	<b>10_04_2017</b>	<b>03_04_2017</b>	<b>17_04_2017</b>	<b>01_05_2017</b>	<b>20_03_2017</b>

Source: SQL database viewed using Sequel Pro<sup>28</sup>

This then has links to the ids of entries in the day table, where the actual information as to whether a user is free is stored.

Name	Variable Type	Description
<b>Id</b>	Int	This is the key of the table, and is linked to by the entries of the week table.
<b>a02</b>	Bool	This contains the information as to whether the user is free at this time. It was decided that 2 hour intervals were the

<sup>28</sup> (SequelPro, n.d.)

		correct length – offering simplicity for both booking appointments and for creating a timetable as a helper.
<b>a24</b>	Bool	As above
...	Bool	As above.
<b>a2224</b>	bool	<p>As above. Though it was considered unlikely that appointments would be booked in some of these timeslots it was decided that it would be better if they existed anyway, never to be used.</p> <p>However, it is important that in the User Interface for creating this timetable, that the work is minimised by defaulting that the timeslots which are the least likely are defaulted as being false.</p>

**Figure 10: Example of data in the ‘Day’ database**

<sup>29</sup> (SequelPro, n.d.)

### **Default Calendar**

When a new user is created, a new timetable is also created, with an initial timetable which consists of being free during the afternoon and evening during the week and during the entire day during the weekend. This was because we anticipate people being at school during the week, and therefore being busy during those times.

### **Appointments**

The appointments information contains the information of the appointment for both the helper and the elderly person, with an entry being created when an elderly person creates an appointment, either via the app or via the SMS system.

Name	Variable Type	Description
<b>Id</b>	Int	This is the key for the table.
<b>helperId</b>	Int	This contains the information of who is the helper who has been assigned to solve the problem.
<b>elderlyId</b>	Int	This contains the information of the elderly person to be helped.
<b>dateAndTime</b>	DateTime	This contains the date and time of the appointment
<b>dateAndTimeCreated</b>	DateTime	This contains the date and time that the appointment has been created.
<b>ratingId</b>	Int	This contains the id (reference to the ratings table) of the rating given to the helper after this job has been completed.
<b>reviewId</b>	Int	This contains the id (reference to the reviews table) of the helper once the job has been completed.

### **Ratings**

The ratings table is where the ratings of the job are stored, with each appointment having one or no entry in the ratings table.

Name	Variable Type	Description

<b>Id</b>	int	Key of the table
<b>starRating</b>	Int (range between 0 and 10)	This contains the information of how many stars the helper has been given for this particular job.

It's important to note that it was decided that the options for the ratings of the helpers would only be integers between 1 and 10. This was decided in order to simplify the system as much as possible – ensuring that the system would be easy to use for the elderly person who is trying to rate their helper.

### Reviews

The reviews table is where the reviews of the job are stored, with each appointment having one or no entry in the table.

Name	Variable Type	Description
<b>id</b>	int	Key of the table.
<b>review</b>	Varchar(10000)	This contains the review – which has been decided to have a maximum length of 10,000 character – around 1,500 words. This has largely been put as an exceedingly large maximum. We expect the length of each review to be significantly shorter. Therefore, the MySQL database has been programmed to reduce the amount of space used by this field to be reduced to the length of the text, once it has been added.

### 2.2.2 - Communications with applications

There were a couple of immediate ways to communicate with the database to get all the required data from it. The first was through immediately communicating with it, while the second involved producing a local API which could be used to communicate to the SQL server and return the required information. The first, while inherently simpler, offers the challenges that code would have to be

repeated on all applications when tasks like verification of data entry would be required. Even more importantly, it means that the security is much reduced as the data could be intercepted en-route as encrypting this transfer of data would be much more challenging. In fact, though Oracle do provide a system by which this connection can be established, they expressly suggest that you avoid it. Therefore, I decided to produce an API which could allow the code to be securely centralised.

## 2.3 – WebAPI (Appendix A – Web API Code)

I decided to use the REST standard for creating an API, which offers a number of important steps for communicating with HTTP requests, ensuring they are only of type: “GET”, “POST”, “PATCH”, “DELETE”, “PUT”. It also established the use of Json to both send and receive data between the client and the server.

I also decided to use a .NET core API, as I had prior knowledge of .NET programming, therefore would not have to learn how to use PHP, the other language which appears to be largely used for this. By using Microsoft’s IIS and .NET core libraries for Ubuntu 14.04 meant that I could largely test using my computer using a local SQL server as the database to communicate with as they were identical on my computer as on the server.

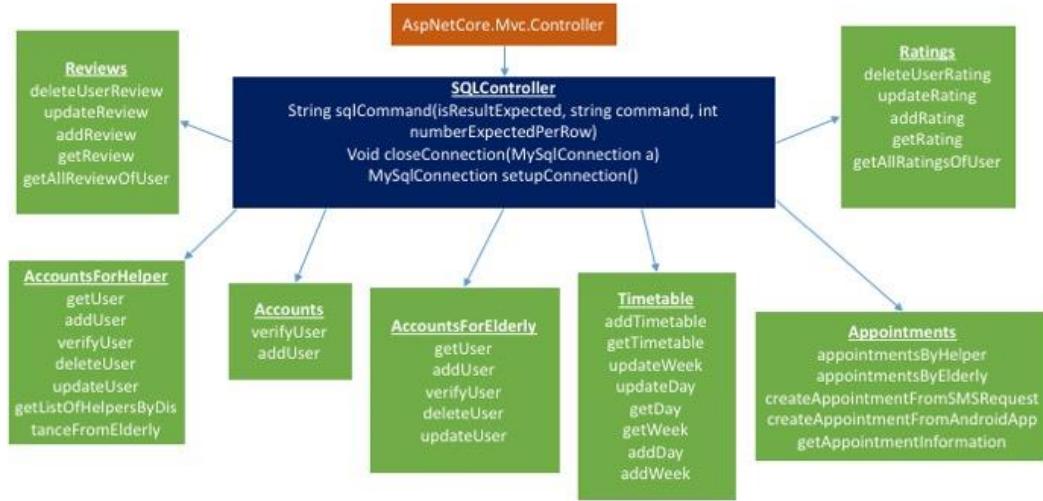

### 2.3.1 - General Structure of .NET Core API

The .NET core API effectively creates a tunnel through which a number of controllers can act as listeners, awaiting a command which meets the HTTP request type that they are defined to listen to – responding to the command when the command type and URL are in one of the controllers.

In order to produce this, there must be a number of files which define how the API works, including defining the namespace of the controllers and defining the dependencies and the runtimes that the API should work on.

All the controllers must inherit from the AspNetCore.Mvc.Controller class. In fact, in order to simplify in dealing with the SQL server, there is an intermediary class, SQLController (SQLStuff.cs), which inherits from Controller. This is inherited by all of the controllers. Hence, there is the following hierarchy chart.

Figure 11: Hierarchy Chart of Controllers

In order to communicate with the SQL server, the .NET Oracle SQL Server package is used, being acquired with a NuGet request to ensure that it can be retrieved every time the server script is run, thereby ensuring it exists everywhere.

### 2.3.2 - Communicating with JSON

Communicating with JSON was the obvious choice, with the only other option being XML. However, the greater availability of libraries to parse the JSON data on both the android application side and the Web API side meant that JSON was a better choice. An example of communicating with JSON in the WebAPI is available here: [HttpCommandOut.cs](#)

For the Web API, in order to deserialise data which is inputted to the WebApi, the '[From Body]' tag is used, which calls the System.Net.Json deserializer to process the data to the object which is defined in the definition of the function. When data is to be sent as Json, it is either passed directly as the object, as this would automatically be converted to Json or it is explicitly converted to Json using the Newtonsoft.Json library if this is necessary.

### 2.3.3 - Communicating with the SMS Server ([SmsStuff.cs](#))

In order to communicate with the SMS server and the Google Maps API, which require GET and POST requests, the [HttpWebClient](#) library ([accountsForHelper.cs](#)) is used (in a composition fashion, in order to allow the rest of the system to function without adaptation).

### 2.3.4 - Functions

	Function Name	HTTP type	URL	Input	Output
<b>Accounts</b> <b>(Accounts.cs)</b>			/ac		

	HelloWorld	GET	/ac		"Hello World"
	AddNewUser	POST	/ac/users/ad	User	Boolean (success or failure)
	VerifyUser	POST	/ac/users/vf	UserToBeVerified	User (empty if failed, populated if successful)
<b>AccountsForHelpers (accountsForHelper.cs)</b>					
	HelloWorld	GET	/ach		"Hello World"
	GetInfo	GET	/ach/users/gi{id}	Int id	Returns a user (see the definition of the user class below).
	GetNearestHelpers	GET	/ach/users/gl{id}	Int Id of the current user,	List of the nearest helpers, to allow the elderly to pick which of the people to pick.
	DeleteUser	DELETE	/ach/users/rm	Int id of the user	Returns a bool of success or failure.
	UpdateUser	PATCH	/ach/users/up	Int id of user, user (see definition of class below)	Returns bool of success or failure
	AddNewUser	POST	/ach/users/ad	User (see definition of class below)	Returns bool of success or failure
	VerifyUser	POST	/ach/vf	UserToBeVerified (see definition of class below)	Returns id of userLoggedInto or null if failedToLogin
	mergeSort	NA	NA	List of users and address of elderly to sort by nearest to	Sorted list of users

	merge	NA	NA	Two lists of user to merge	One list of merged users
	getDistance	GET	/ach/users/gd	Two string addresses	Double distance between the two in km
	fileGetContents	NA	NA	String filename	String contents
<b>AccountsForElderly (accountsForElderly.cs)</b>					
	HelloWorld	GET	/ace		"Hello World"
	GetInfo	GET	/ace/users/gi{id}	Int id	Returns a user (see the definition of the user class below).
	GetInfoByTelephoneNumbe	NA	NA	String telephoneNumber	Returns a user (see the definition of the user class below).
	DeleteUser	DELETE	/ace/users/rm	Int id of the user	Returns a bool of success or failure.
	UpdateUser	PATCH	/ace/users/up	Int id of user, user (see definition of class below)	Returns bool of success or failure
	AddNewUser	POST	/ace/users/ad	User (see definition of class below)	Returns bool of success or failure
	VerifyUser	POST	/ace/vf	UserToBeVerified (see definition of class below)	Returns id of userLoggedInto or null if failedToLogin

<b>Timetables (Timetable.cs)</b>			/tt		
	getTimetables OfAUser	GET	/tt/gt	Int helperID	Returns timetable (see below for definition)
	addNewTimetable	POST	/tt/adt	timetable	Returns bool for success or failure
	UpdateWeek	NA	NA	week	
	AddDay	NA	NA	day	Int id (in database)
	UpdateDay	POST	/tt/ud	day	Returns bool for success for success or failure.
	addWeek	NA	NA	week	Int id of week
	getWeek	NA	NA	Int id	week
	getDay	GET	/tt/gd	Int id	day
<b>Appointments (Appointments.cs)</b>					
	Create Appointment From SMS Request	POST		DateTime time, string telephoneNumber	Returns appointment (see definition below)
	Create New Appointment From Android App	POST		Appointment (see definition below)	Returns bool of success or failure
	Get Appointment information	GET		Int AppointmentID	Returns appointment
	Remove Appointment	DELETE		Int appointmentID	Returns bool of success or failure

	Get Appointments by Elderly	GET		Int elderlyID	Return a list of appointments
	Get Appointments by helper	GET		Int helperID	Returns a list of appointments
Ratings (Ratings.cs)					
	Get All Ratings Of a User	GET		Int helperId	Returns list of ratings (for definition see below)
	Get One specific rating	GET		Int appointmentID	Returns rating
	Add a rating to an appointment	POST		Int appointmentID, rating	Returns bool of success or failure
	Update rating	PATCH		Int appointmentID, rating	Returns bool of success or failure
	Delete rating	DELETE		Int appointmentID	Returns bool of success or failure

### Timetable.cs)

	id	Int
	defaultWeek	week
	listOfOtherWeeks	List<week>
<b>Week (Week.cs)</b>		
	id	int
	weekBeginning	DateTime
	monday	Day
	tuesday	Day
	Wednesday	Day
	Thursday	Day
	Friday	Day

	Saturday	Day
	Sunday	Day
<b>Day (Day.cs)</b>		
	id	int
	timesFree	Bool[12]
<b>Appointment (Appointment.cs)</b>		
	Id	
	helperid	Int
	elderlyid	int
	dateAndTime	DateTime
	dateAndTimeCreated	DateTime
	Rating	Rating
	review	Review
<b>Rating (Rating.cs)</b>		
	id	Int
	rating	Int
<b>Review (Review.cs)</b>		
	Id	Int
	review	String
<b>UserToBeVerified (UserToBeVerified.cs)</b>		
	emailAddress	String
	password	String

	helper	Boolean
<b>DateTimeExtensions (DateTimeExtensions.cs)</b>		
	Func getWeekBeginning (DateTime dt)	DateTime

While the majority of these simply require a number of SQL commands to return specific data from the MySQL database, a couple of the functions require a little more explanation of how they will work.

#### *Returning List of Nearest Helpers (accountsForHelper.cs)*

In order to order the ordered list of helpers, there are broadly three stages which must be followed:

1. Get all helpers
2. Find the distance from the elderly person for each helper.
3. Sort the helpers by this distance.

#### **Get all helpers**

In order to get all the helpers, it is simply a question of calling a get command of all helpers (this command is only available internally and is not available outside of the API and can't therefore be exploited).

Find the distance from the elderly person for each helper

There were two methods considered to find the distance between two addresses. The first, utilises, just the Google Maps API and treats the direction distance (distance on the road) as the distance. The second uses the Google Maps API to get the longitude and latitude and uses the Haversine Formula to extract the distance between two points using this formula.

It was decided that the former is better as it is more representative of the time taken by the helper to get to the elderly person's house. Therefore, the Haversine formula is not needed.

#### **Sort the helpers by this distance**

In order to sort the helpers by this distance, a recursive MergeSort is used, recursively slitting the list into halves, sorting each half before combining them together using a merge. The process is outlined in the below pseudocode:

MergeSort (List a):

```
If (a.Count() == 1)
```

```
    Return a;
```

```

Else

    Return merge(MergeSort(firstHalfOfA), MergeSort(secondHalfOfA))

Merge (List a, List b):

    List c

    While(a and b have elements):

        If (a[0].distance < b[0].distance)

            c.Add(a[0]);

            a.RemoveAt(0);

        Else

            c.Add(b[0]);

            b.RemoveAt(0);

    While(a has elements):

        c.Add(a[0]);

        a.RemoveAt(0);

    While(b has elements):

        c.Add(b[0]);

        b.RemoveAt(0);

    return c

```

#### *Create New Appointment from SMS request ([Appointments.cs](#))*

In order to do this, the function completes the following tasks:

1. Gets the user information of the elderly person from the telephone number
2. Gets the list of nearby helpers to the elderly person
3. Parses the sms into a date and time
  - a. ^
4. Find the first helper who is free at that date and time, book appointment (using create new appointment from Android App)
  - a. \*
5. Send an SMS to the original sender with the information about the appointment.

**Considering ^**

In order to parse the SMS and return the date and time that the user wants to have the appointment, there were a few possible ways of doing this. The first involves creating my own system to search for all possibilities including things like ‘tomorrow’ and ‘today’ which would each need to separately catered for.

Therefore, it would be simpler to make use of existing APIs. While it would be significantly more effective to use something like the IBM Watson Natural Language processing API, it proved much simpler to use a `DateTimeNaturalLanguageParser` for C# that I found published under the MIT license on GitHub (`DateTimRoutines.cs`). While not perfectly effective – for example the year must always be stated otherwise, it does not return any of the correct date – it generally works.

#### Pseudo Code of \*

Foreach helper in list of helper:

```
Timetable t = Get Timetable (helper.timetableId)

DateTime dt = findWeekBeginning(dateTimeSMS)

If dt.ToString() exists in t.weeks[x].weekBeginning:

    Day correctDay = t.weeks[x].week.(dateTimeSMS.DayOfWeek.ToString() + "id")

    If correctDay.timesFree[dateTimeSMS.Hour / 2]:

        Create appointment with this helper at this time

        Send SMS to user with this information

    Else

        Next helper

Else

    Day correctDay = t.defaultWeek.(dateTimeSMS.DayOfWeek.ToString() + "id")

    If correctDay.timesFree[dateTimeSMS.Hour / 2]:

        Create appointment with this helper at this time

        Send SMS to user with this information

    Else

        Next helper
```

If still haven't found a helper, then send SMS saying “Noone could be found”

#### *Create New Appointment from AndroidApp (Appointments.cs)*

The function must complete the following tasks:

1. Convert the dateAndTime into the week beginning data and the day.

2. Check whether that week beginning is a special week for the helper, or whether it falls inside the default week.
  - a. It does this by getting the timetable for the helper, and checks whether the date of the week beginning is the same as the week beginning date for any of the custom weeks.
    - i. If it isn't one of the weeks already there, then it creates a new column and clones the defaultWeek from all the items and puts their ids into the new column.
    - ii. Then, it recurs on the same function, this time confident that it will find the new column
3. Check whether the helper is free at the time on that day, looking inside the correct entry of the 'day' table.
4. If it is free, the appointment can be booked and the time should be changed to being used and the appointment added to the tableOfAppointments.

Retrieving timetable from database ([timetable.cs](#))

1. Go into the INFORMATION-SCHEMA for the table and retrieve the names of the columns.
2. Then retrieve the value of the entry for each of these columns – converting the name of the column into a DateTime value for the weekbeginning date for the column
  - a. Then for each of these weeks, extract the week from the week value.
    - i. Do this by extracting a day from the day ids from each day of the week table of the week entry.

### [2.3.5 - Securing data](#)

An important part of the decision to choose to use a WebAPI was in order to maximise the security of the system, by ensuring that people couldn't retrieve the placement of the server and simply issue SQL commands to retrieve all the data on all the users. There are a couple of other simple measures which can be taken to further maximise the security of the data, even if the connection is insecure.

### [Hashing Passwords \(MD5Hash.cs\)](#)

By hashing password, we can maximise the security of the passwords in a couple of different ways. Firstly, from a user's perspective, it assures them that we don't have access to the password and thereby ensures that they are comfortable with using the site (though it would still be advisable to use a different password than others for this account). It also means that should hackers manage to penetrate the security of the server, which will be minimised as far as possible, through root security in Ubuntu 14.04, they will struggle to retrieve passwords from the hashed values of the passwords.

Therefore, the passwords will be stored as the hashed value – with the passwords being hashed using the MD5 cryptographic hash, which produces a 128-bit hash. This, while not perfectly secure, draws a good compromise between the time taken to hash on the client side (on the app) and security.

### [2.3.6 - Verifying data entry](#)

It has been decided that for speed of the system, the main verification will be done on the application side, being completed without requiring the application to make any calls to the WebAPI. This also ensures that the end user can have more coherent error messages. However, there are a few things which cannot be checked by the application and therefore must be checked during the server's functions

Therefore, the following checks must be carried out during verification:

Task	Input	Check
<b>Adding or updating a user</b>  <b>(accountsForElderly.cs, accountsForHelper.cs)</b>		
	emailAddress	Already used?
	telephoneNumber	Already used?

## 2.4 - Android App

While I had otherwise intended to create two android apps, one for the helpers and one for the elderly since I assumed that they would largely be entirely separated, I have found they are in fact rather similar, and by creating ‘one’ app, they could inherit large portions of the backend code from one another. Therefore, I am only creating one android app, though with two separate timelines for the elderly and for the helpers. Therefore, for the purposes of this report, I am going to deal with the design together, though they share a couple of screens.

For the Android apps, I chose to work in Xamarin.Android, which allows me to use existing skills in C# and XML and combine them to produce a functioning Android Application. This also means that I can reuse much of the code for the classes in the WebAPI in order to produce the Android Apps, for example the classes for the users and timetables.

### 2.4.1 - Important Features

#### *Communicating with Web API*

In order to communicate with the WebApi, the Android App makes use of the RESTSharp library, which deals with the communication entirely, allowing the programmer to just say the method, the data, and the URL of the communication. (An example of this is in the UserDetails function here: WelcomeHelpers.cs)

Unfortunately, these functions must be often repeated on a number of screens as there must be subtle changes in the URL and / or the data expected.

In order to serialise the data to be sent to the API and to deserialise the JSON input from the API, the NewtonSoft JSON library is used, with it defining the object and object type to convert to JSON.

#### *Communicate with SMS Server (RegisterActivity.cs)*

To communicate the SMS server, the Android App again makes use of the RESTSharp and NewtonSoft.Json Libraries which can be acquired using a NuGet packages and therefore are included as part of the package of the Android application when it is installed.

### *Remembering Logins (LoginActivity.cs)*

In order to remember the login and password, the Android application stores the information in a SQL database, using the SQLite database to store the following information:

Name	Type
<b>emailAddress</b>	VARCHAR(50)
<b>password</b>	VARCHAR(50)

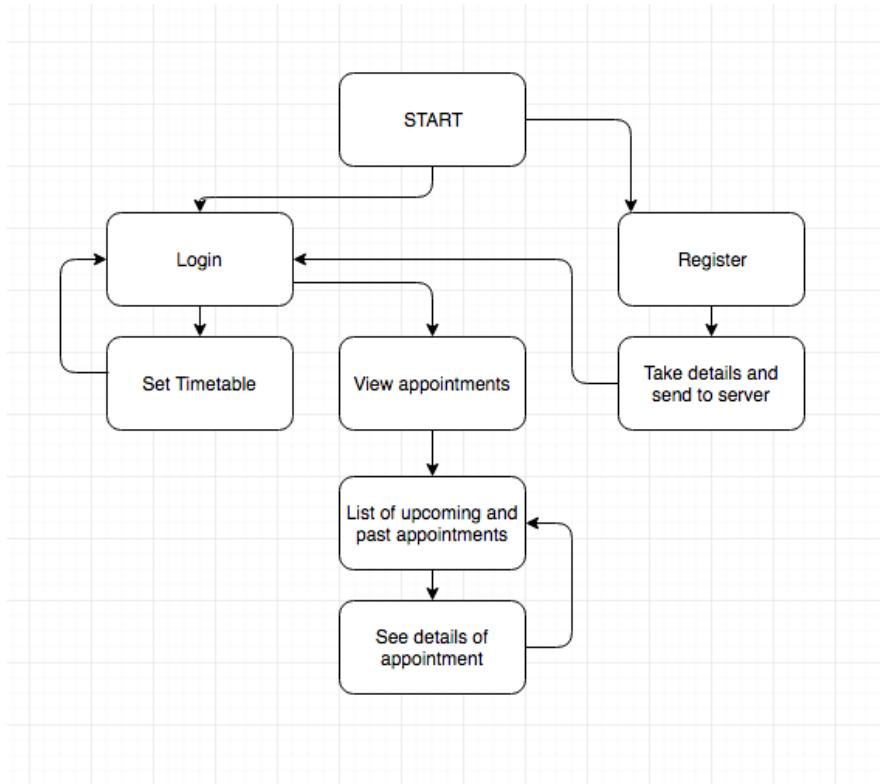

When the user logs in, the username and password is added to the database. The password is added in plaintext as it would be impossible for anyone to gain access to the database. When the login screen is reached again at any point, the application first checks through the database and attempts to login with information from the database.

#### **2.4.2 - Helpers**

##### *Main Flowchart*

The flowchart shows the system without the addition of in case of problems.

**Figure 12: Flowchart of Helpers Android Application**

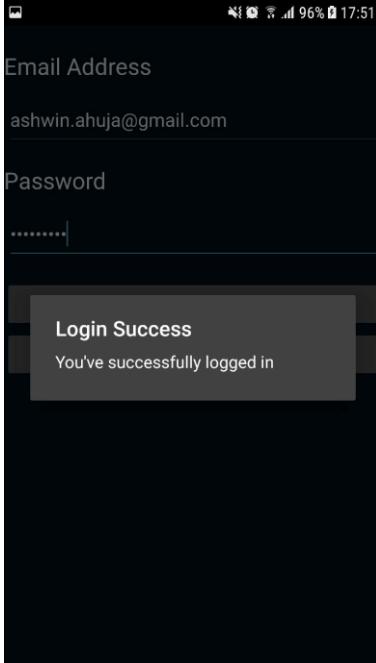

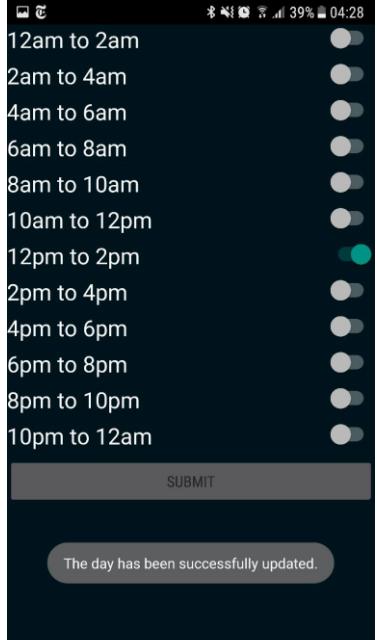

## User Interface

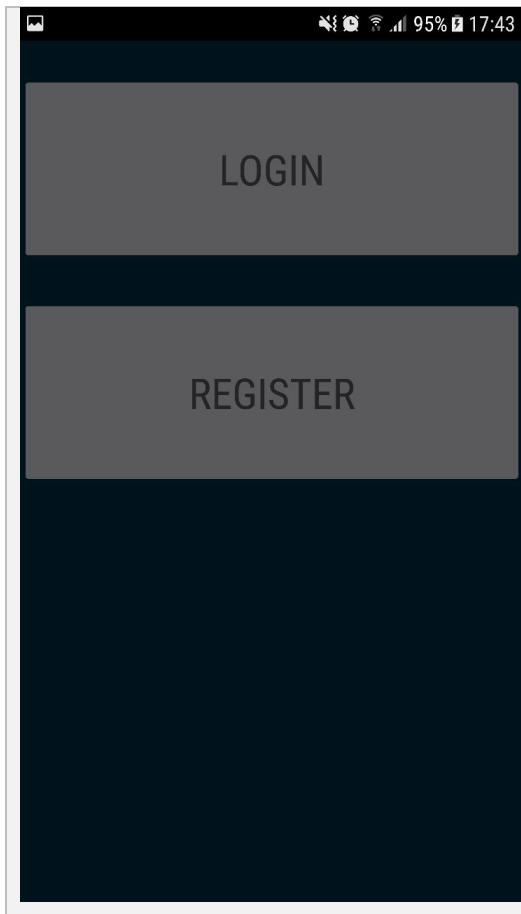

### Dialog Methods

In order to give critical information to the user, two main methods were used, where one entirely removes everything else from the page, and forces the user to look at it. This is an Android Alert Dialog. This is used mostly during the login and registration, where the information to be gained is vitally important to the function of the application and the success of the user to get into the application properly.

The other type are toast notifications, which are used more subtally, for example to tell the user that a change that they have made has gone through successfully, as in the below example

Alert Dialogs	Toast Notifications		
			
Start	<table border="1"><thead><tr><th>UI</th><th>Activity</th></tr></thead></table>	UI	Activity
UI	Activity		

<sup>30</sup> (Draw.io, 2017)

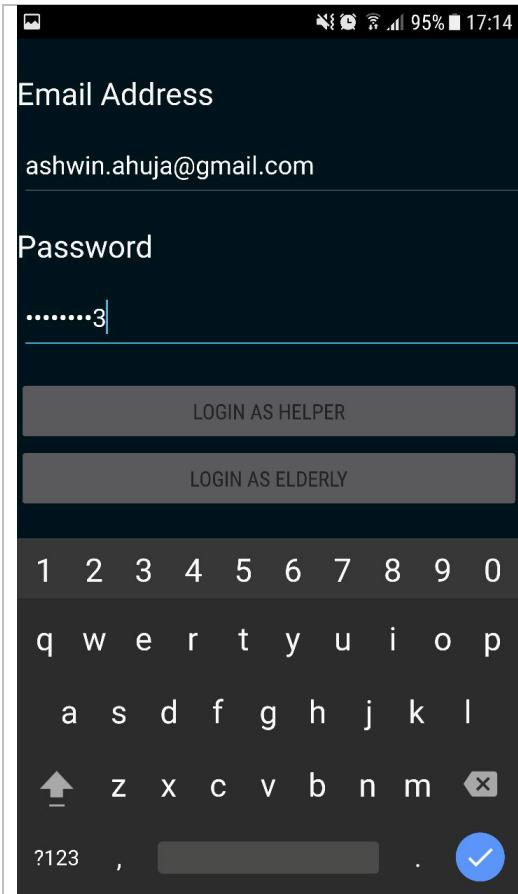

**OnCreate:** Initialises view.

**LoginButtonClick:** When the button is clicked, go to the login screen.

**RegisterButtonClick:** When the button is clicked, go to the register screen.

The start allows a user to create a new account or login by clicking one of the buttons.

## Log In

**OnCreate:** Go through the database and attempt to login with any of the accounts stored in the database or create a table if it doesn't already exist.

**LoginAsHelperClick:** Attempt to login as a helper.

**LoginAsElderlyClick:** Attempt to login as an elderly.

**checkIfEmpty:** Shows a dialog box if all information is not present

**login:** Returns a true or false dependent on whether the login is successful.

The login window provides two text boxes with text explaining what is to go in the boxes. The password boxes will, once filled in, appear as a series of dots, by using the Android password box, in order that those in the vicinity of the user not be able to see the password.

## Register

The registration screen, common for both the elderly and helpers offers the opportunity for the users to enter all the required information to register. Though I considered creating a toggle switch for elderly or helper, this separate buttons method appears more clear and easy to use – this is very important for the elderly. Once the registration has gone through, there is an alert saying “registration succeeded” or “registration failed”. If the registration is successful, they receive a message with the verification code for the twilio call which they will receive within the next two minutes.

The screenshot shows a mobile application interface for user registration. The form consists of the following fields:

- First Name: [Text Input]
- Surname: [Text Input]
- Email Address: [Text Input]
- Username: [Text Input]
- Password: [Text Input]
- Confirm Password: [Text Input]
- First Line of Address: [Text Input]
- Second Line of Address: [Text Input]
- City: [Text Input]
- Country: [Text Input]
- Postal Code: [Text Input]
- Telephone Number: [Text Input]

At the bottom of the form are two buttons:

- REGISTER AS HELPER
- REGISTER AS ELDERLY

#### OnCreate:

##### RegisterRegisterAsHelperClick:

- checkValid
- registerTheUser
- verifyNumber
- checkVerify to get the userId
- if it doesn't get verified, deleteUser (and force them to reregister)

##### RegisterRegisterAsElderlyClick:

##### checkValid:

- Checks if any fields are empty or if the telephone number is invalid.
- If invalid then show dialog box and returns false

##### deleteUser:

- Sends the REST request to the API to delete the user account.

##### testVerify:

- Completes the same function as in login and returns the user.

##### register:

- POSTs the data to the API to add the account.

##### verifyNumber:

- POSTs the number to the SMS server and shows the return, the verification code, to verify the telephoneNumber.

Second Line of Address: \_\_\_\_\_

City: \_\_\_\_\_

**Registration Unsuccessful**

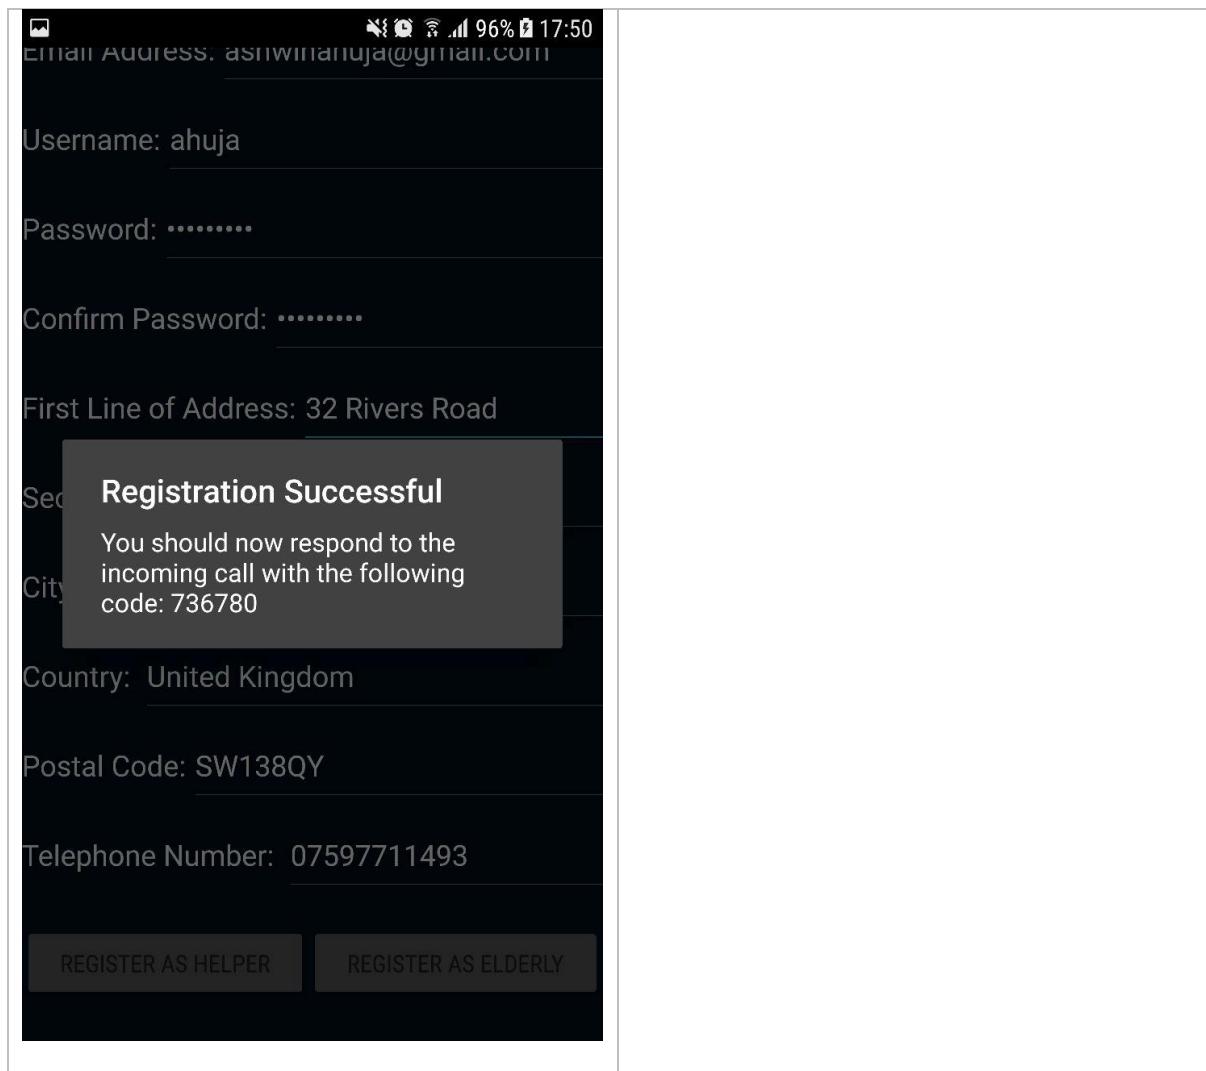

Not all required fields have been filled.

Country: United Kingdom

Postal Code: SW138QY

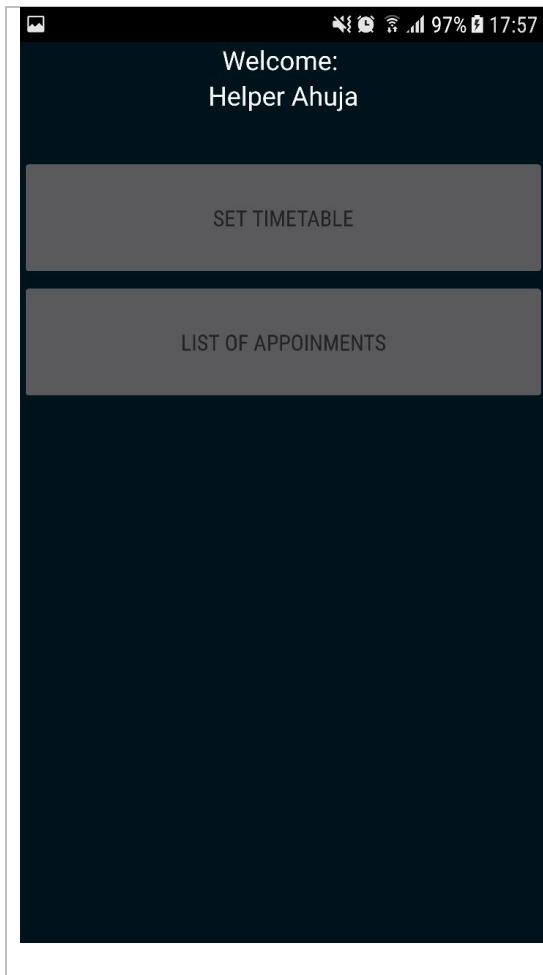

Telephone Number: 07597711493

[REGISTER AS HELPER](#) [REGISTER AS ELDERLY](#)

Logged in

Upon login, the user gets to access either part of the app, the appointment side, or the timetable side through two buttons.

**OnCreate:**

- Populate the name textview using information from GetUserDetails.

**SetTimetableClick:**

- Open the setATimetable activity.

**ListOfAppointmentClick:**

- Open the listAnAppointment activity.

**GetUserDetails:**

- Send the REST request to the Web API and returns the user details.

### View Appointments

From any deeper than this in the app, there are always back buttons (on the android device) which allow the user to move back in the pages they have visited, therefore allowing them to visit every site. This screen easily shows all the appointments, displaying their times.

The view appointment screen simply offers the list of all of the appointments which exist. They are ordered such that the upcoming appointments are listed first (closest first) before they go backwards in time. For each appointment, it says the name of the elderly person with whom the appointment will (or has) occurs as well as the time.

All the appointments can be clicked on to get more details about the appointments.

#### OnCreate:

- Get list of appointments.
- Foreach of the appointments, get the name of the elderly person (using getUserDetails).
- Populate the list view in the order of upcoming first (closest first), then going back in history

#### OnListItemClick:

- Call the activity to show more details about that appointment.

#### returnListOfAppointments:

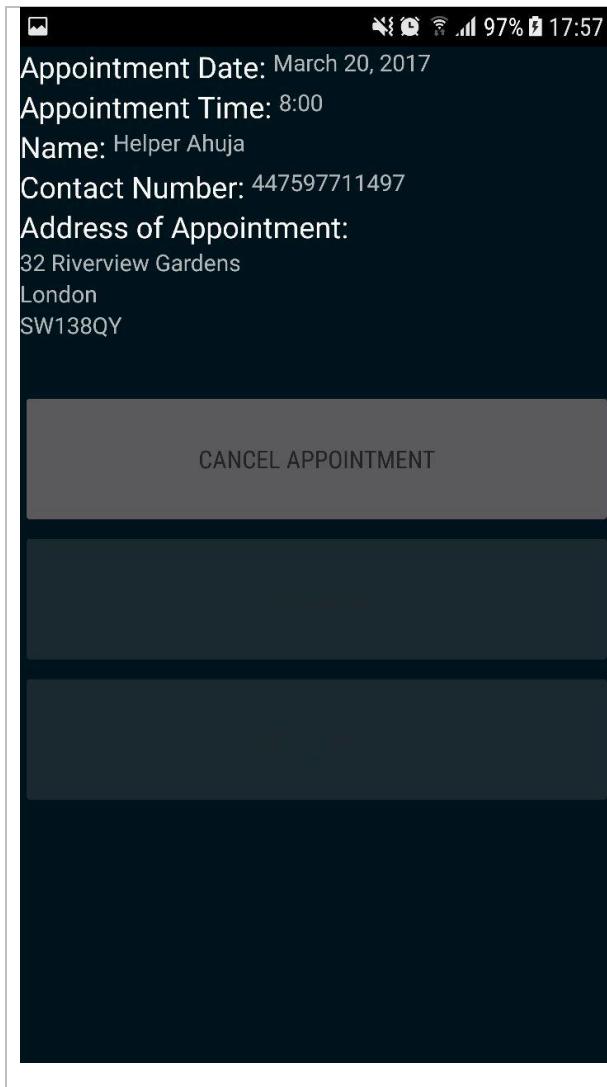

- From the helperId, this makes a call to the REST api and returns the list of appointments.

#### getUserDetails:

- Makes a call to the Web API and returns information about the user.

#### See details of Appointment

This is the view which is displayed when the user clicks on any one of the appointment. It offers more information about the appointment, including things like the time, contact number and address of the appointment. Additionally, if the appointment is in the future, the appointment can also be cancelled.

#### OnCreate:

- GetAppointmentDetails of appointment to show in more details.
- Populate the text views using details from GetUserDetails
- If in the past, ensure that cancel appointment is not enabled. If in the future, it should be enabled.

#### CancelAppointmentClick:

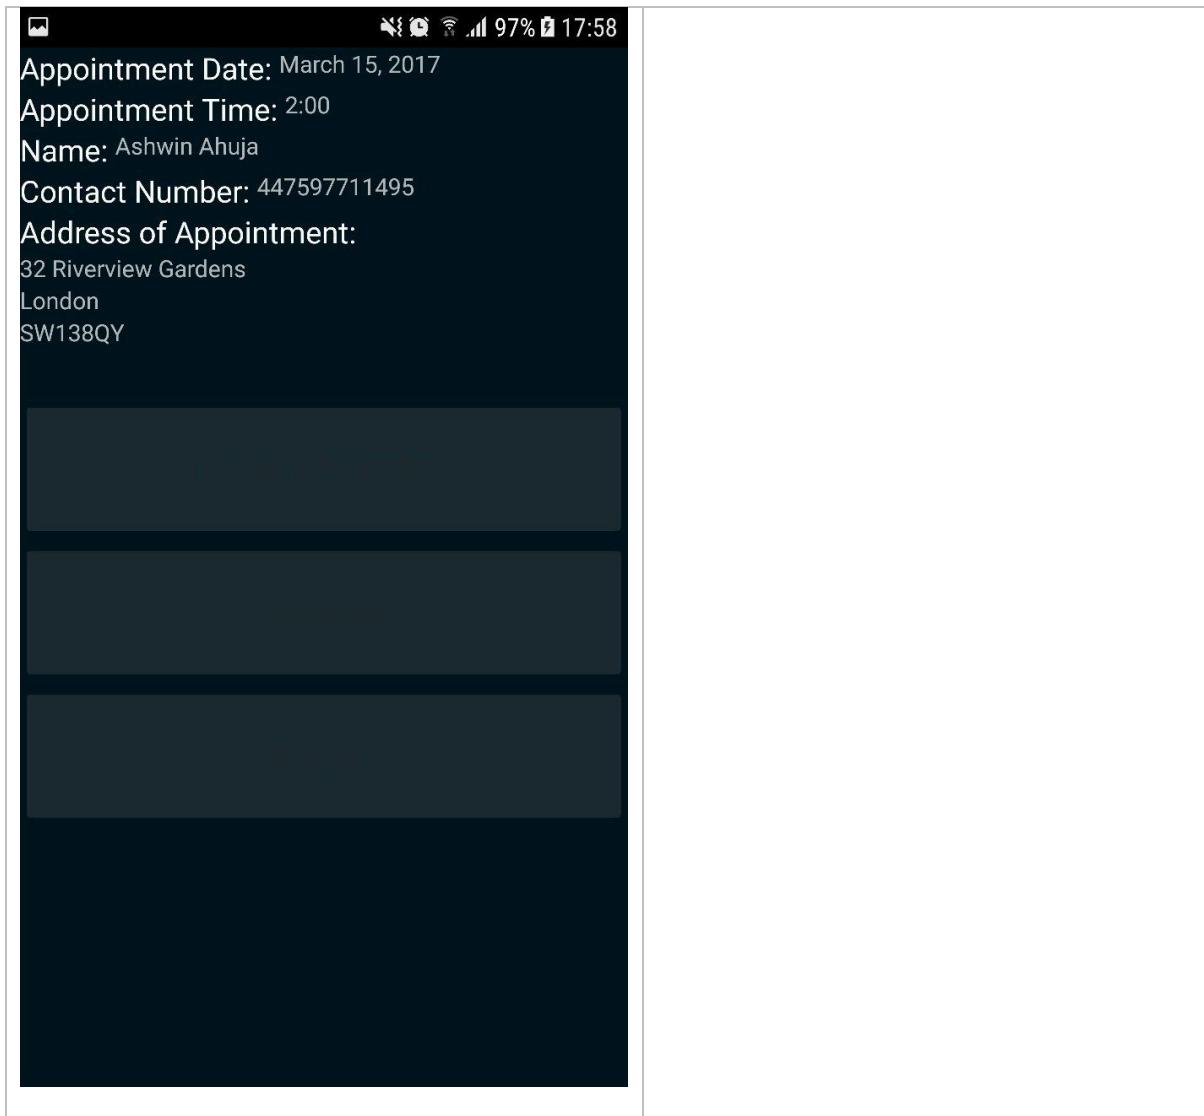

- Send the request to the Web API.

#### GetUserDetails:

- Send request to Web API and return the user information.

#### GetAppointmentDetails

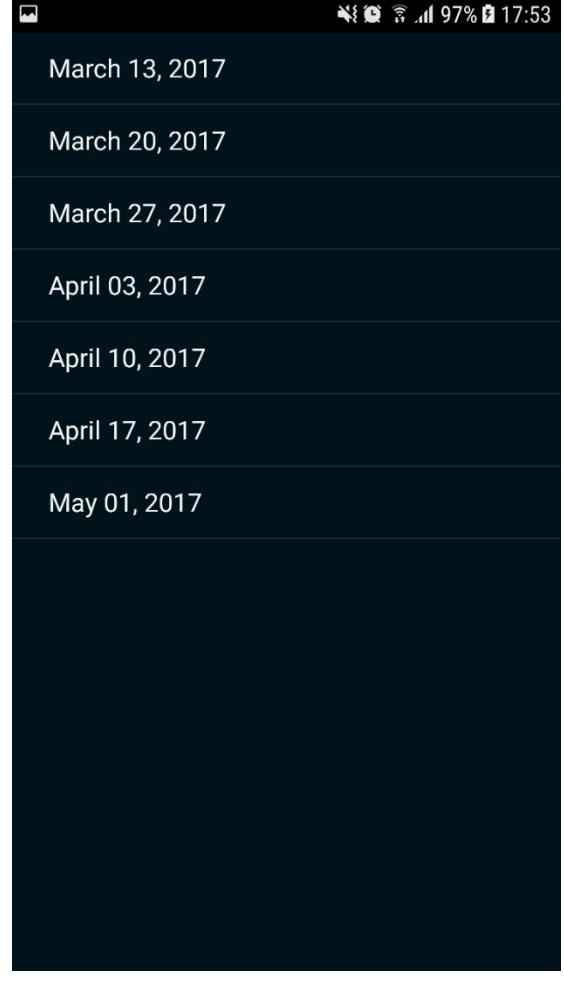

- Send request to Web API and return the appointment.

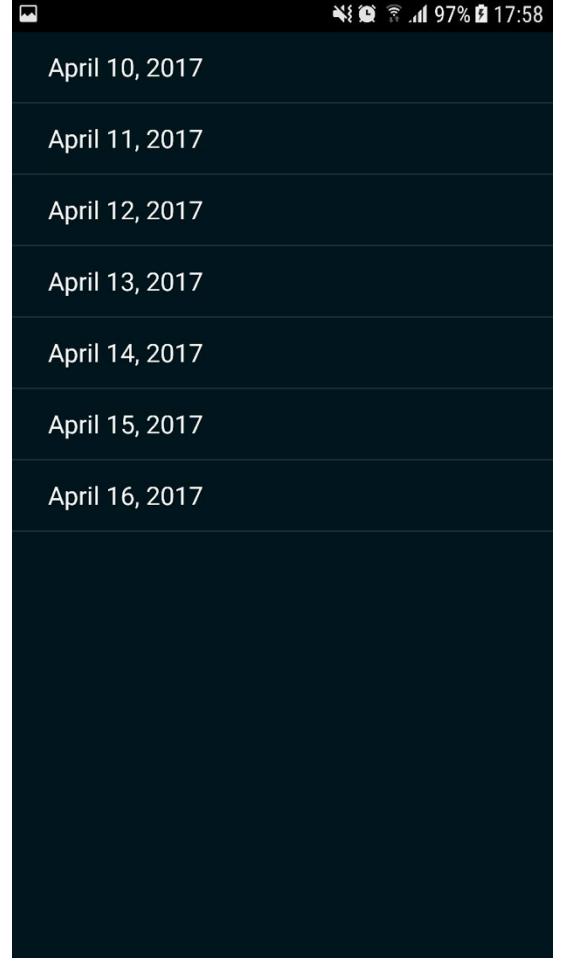

### Set Timetable

The process for setting up a timetable is split into a number of parts, with the person first choosing which week to tackle (with the next seven weeks displayed), followed by which day, followed by then changing the timetable for that particular day.

The first screen shows the week beginning date for the next seven weeks, allowing them to click one of them and alter their timetable in any one of those weeks.

 <p>The screenshot shows a list of dates on a mobile device. The top status bar indicates the date as March 13, 2017, and the time as 17:53. The list contains the following items:</p> <ul style="list-style-type: none"> <li>March 13, 2017</li> <li>March 20, 2017</li> <li>March 27, 2017</li> <li>April 03, 2017</li> <li>April 10, 2017</li> <li>April 17, 2017</li> <li>May 01, 2017</li> </ul>	<p><b>OnCreate:</b></p> <ul style="list-style-type: none"> <li>• Populates the view with the readable name (MMMM dd, yyyy) of the week beginning date of the next seven weeks which could be set.</li> </ul> <p><b>OnListItemClick:</b></p> <ul style="list-style-type: none"> <li>• Starts the activity of the setting timetable of week view – passing the date beginning date as a parameter.</li> </ul>
--	---

Upon clicking upon one of the weeks, the next screen displays the date of all the days in that week, each of which can be clicked to set the timetable for that day.

	<p><b>OnCreate:</b></p> <ul style="list-style-type: none"> <li>• Populates the view with the dates of all of the days of the week – therefore any of them can be selected and the free time can be changed.</li> </ul> <p><b>OnListItemClick:</b></p> <ul style="list-style-type: none"> <li>• Starts the activity of the setting the free times, passing the parameter of the exact day whose timetable should be changed (based on which item has been clicked).</li> </ul>
--	---

On clicking any one of the days, the screen for setting the timetable for that day is opened. It is a simple interface consisting of only toggle switched, which show whether the person is free for that specific time. Though the free and busy positions are not labelled, due to the clear ‘on-off’ colouring, it is reasonably obvious that on means free.

There is a submit button at the bottom which when clicked commits the changes to the timetable. When the change occurs, there is a toast notification, which tells the user that the change has successfully occurred.

#### OnCreate:

- Initialises the view and calls the `getCorrectStatusOfButtons`

#### getCorrectStatusOfButtons:

- Calls the `getTimetableOfHelper` and finds the correct day value (either from a specific week or from the default week entry).
- Populates the toggle switches on the view with 'on' or 'off' based on whether they are currently free at that time or not.

#### submitButtonClick:

- Calls `assembleDay` and replaces the existing day in the timetable object of the user with this day.
- If the week already exists, this is simply changing a day, otherwise a new week is created and the day can then be replaced.
- Then a request is sent to the WebAPI to add the timetable and replace the `timetableId` in the `accountsTable`.

#### assembleDay:

- Converts the status of the buttons into a day object.

#### getTimetableOfHelper:

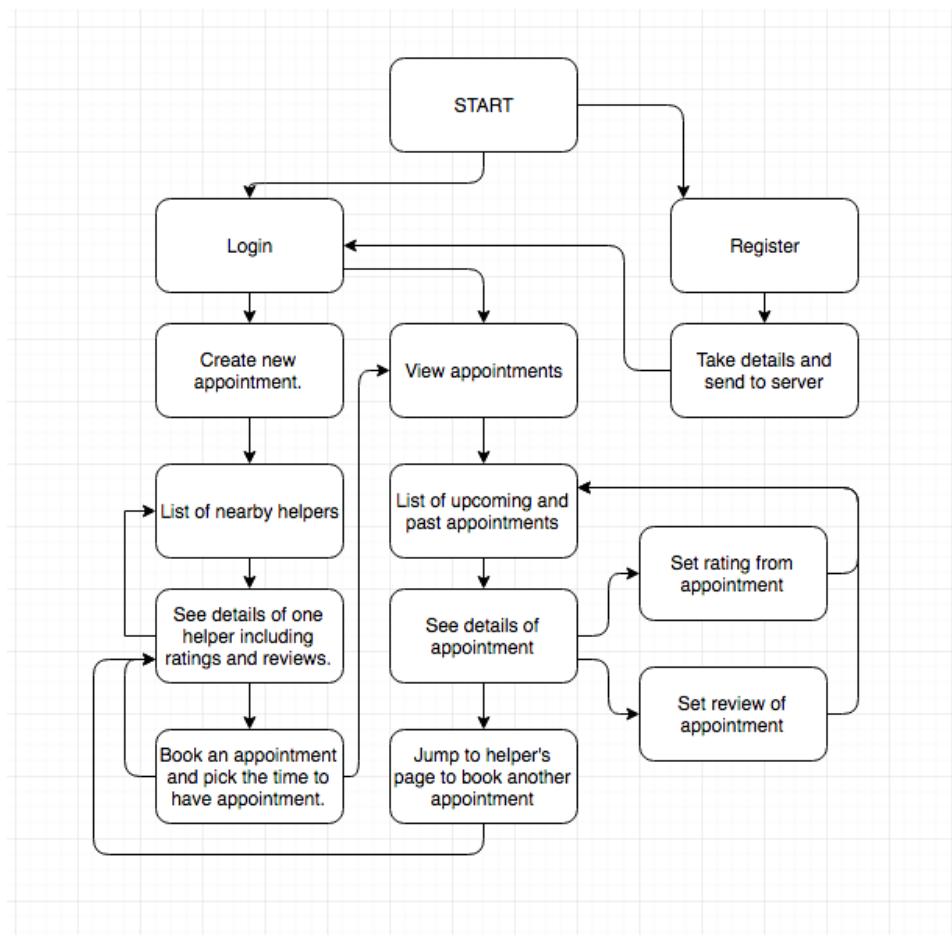

- Sends a request to the WebAPI with the parameter of the id of the `timetableId` and returns the timetable of the user.

### 2.4.3 - Elderly

#### Main Flowchart

The flowchart below is the main flowchart of the app, showing how a user can carry out all of the task- with each of the boxes corresponding to a single screen on the design. It must however be noted that this assumes successes in all activities, such as assuming that the password is valid and the user successfully logs in.

Figure 13: Flowchart of Elderly Android Application

Source: Produced using draw.io<sup>31</sup>

### User Interface

#### Design Ethos and Colours

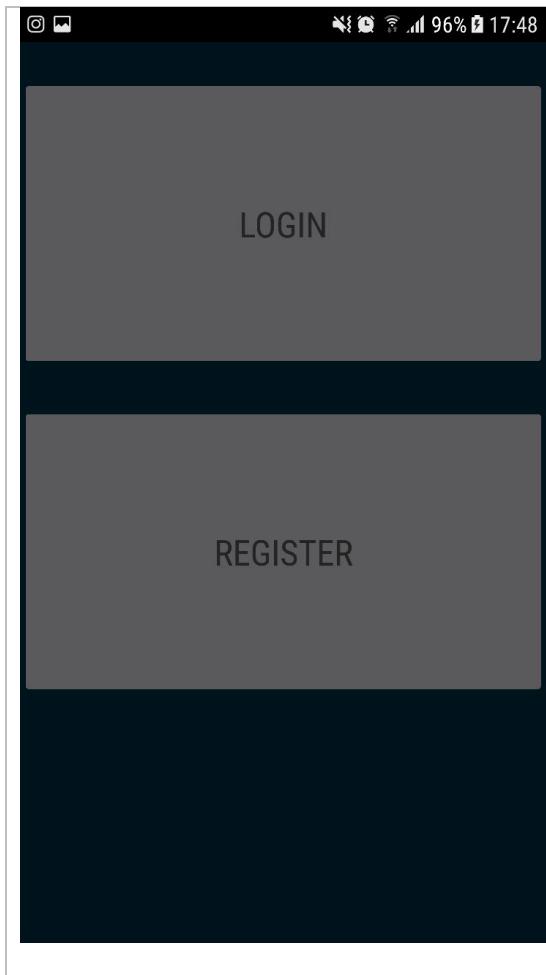

Foremost in my mind when designing the system for the elderly was the suggestion by Mrs Wilson that no screen should have more than two things happening on that screen. Therefore, a large (possibly excessively so) number of screens exist in the application in order to allow the user to be able to cope easily with each of the screens.

With regards to colours, additional research revealed that due to issues with eyesight, in particular the fact that the retina tends to break down more quickly than the rest of elderly eyesight, they tend to lose the ability to see colour. Therefore, it is more important to focus on contrast, to show differences in parts of the design. Therefore, the design generally consists of a 'Black-White' colour scheme, to maximise the contrast.

#### Start

The first few screens are entirely identical to those in the helpers side, so no additional commentary is provided.

<sup>31</sup> (Draw.io, 2017)

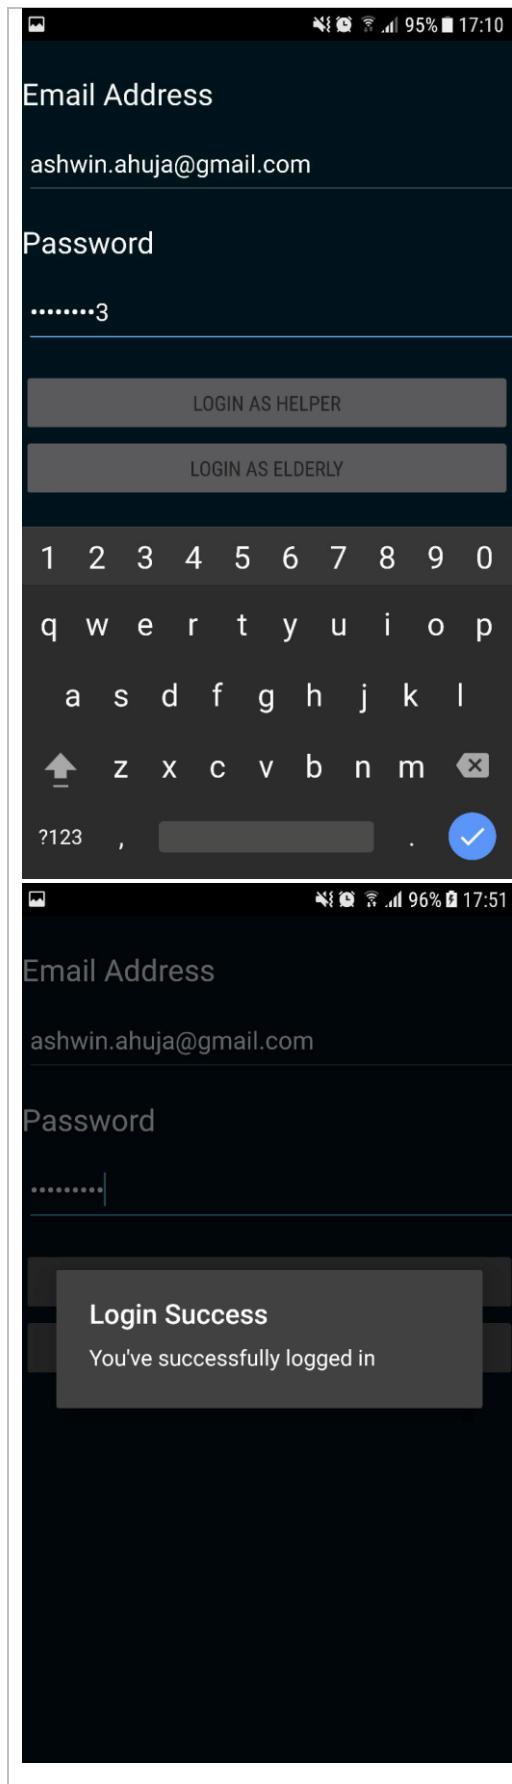

**OnCreate:** Initialises view.

**LoginButtonClick:** When the button is clicked, go to the login screen.

**RegisterButtonClick:** When the button is clicked, go to the register screen.

## Login

**OnCreate:** Go through the database and attempt to login with any of the accounts stored in the database or create a table if it doesn't already exist.

**LoginAsHelperClick:** Attempt to login as a helper.

**LoginAsElderlyClick:** Attempt to login as an elderly.

**checkIfEmpty:** Shows a dialog box if all information is not present

**login:** Returns a true or false dependent on whether the login is successful.

[REGISTER AS HELPER](#) [REGISTER AS ELDERLY](#)

### Logged in Interface

Here, for the elderly, instead of offering the timetable, the user can book an appointment. However, the process for booking an appointment is similar to that of setting a timetable in the sense that it is dealt with in a number of pages, each one making more specific the time and person involved with the appointment.

#### OnCreate:

- Sets up the view of the interface and populates the name of the elderly person.
  - Does this by getting the name from the user returned by the GetUserDetails function.
- It also checks if an appointment has just been booked. If this is true, then the user is redirected immediately to the page with the list of appointments, through Click2.
- *The only reason this exists is so that, if the user were to now press the back button on their phones, they would return to this screen rather than to the booking confirmation screen.*

#### BookAnAppointmentClick:

- Starts the activity related to the booking of an appointment (where the nearest helpers are shown).

#### ListOfAppointmentsClick:

- Starts the activity related to listing all the appointments.

#### Click2:

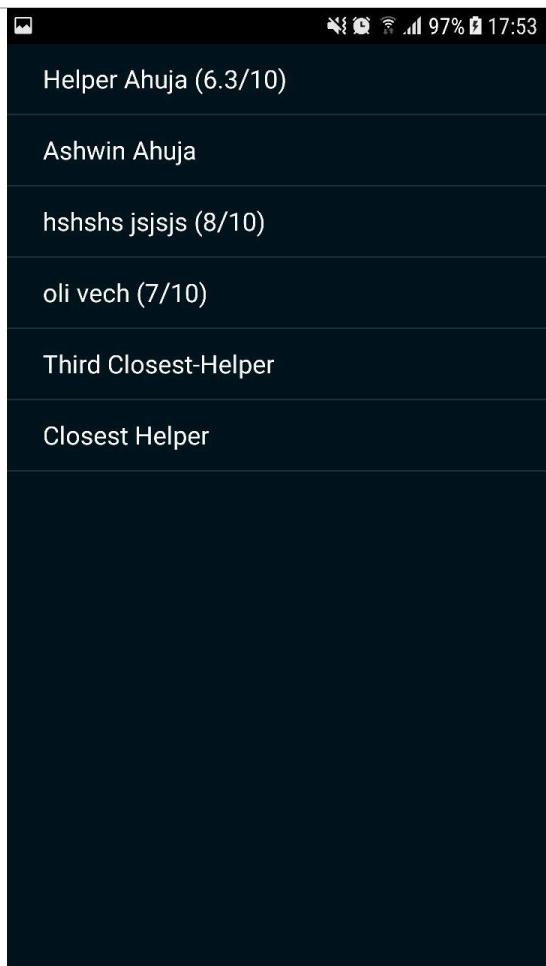

- Calls the ListOfAppointmentsClick (with required event arguments).

#### GetUserDetails:

- Makes a call to the Web API and returns information about the user.

#### Create new appointment

When the person goes into the booking section, they are presented with a list of the nearest helpers as well as their average rating. By clicking any one of the users, they are presented with more information about that helper as well as being offered the opportunity to see the users reviews.

#### OnCreate:

- Gets the list of nearby users (using `GetListOfNearbyUsers`) and converts this into a list of names which can be displayed on the `ListView`.
- Foreach of these names, the `getAverageRating` function is used to get the average rating of the user and display this alongside their name.

#### OnListItemClick:

- Start the helper details activity, passing the `helperId` of the particular item clicked as a parameter.

#### GetListOfNearbyUsers:

- Sends a request to the WebAPI to return the list of nearby users to the location of the `elderlyId` sent to the API.

#### GetAverageRating:

- Completes `ReturnListOfAppointments` for the helper id and for each appointment checks if the `ratingId` = 0 (it has no rating). If it has a rating, then it goes to the WebAPI, requests the rating and adds this to a counter.
- This is divided by the number of ratings found to find the average rating for the user.

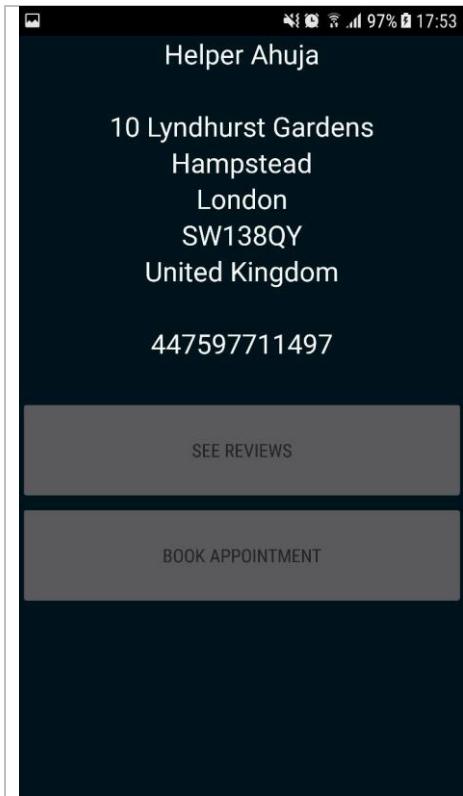

#### ReturnListOfAppointments:

- Sends request to the WebAPI to return a list of appointments, based on the `helperId` and parses the JSON input into an array of appointments.

## Book Appointment

The details which can be seen when clicking one of the users consist of everything from their name, to their contact number and address.

The user can also click to see reviews (this button is only enabled if the user has any reviews) or book an appointment with them.

### OnCreate:

- Populates the details of the helper (including name, address, telephone number etc).
- Also, checks if there are reviews for the helper using `ReviewsForUser`. If there are, then the 'See reviews' button is enabled. Otherwise, it is hidden from the user.

### SeeReviewsClick:

- Starts the see reviews activity.

### BookAppointmentClick:

- Activity for setting the time to book the appointment is started.

### ReviewsForUser:

- Checks if the response to WebAPI asking for list of reviews of user is empty or not.

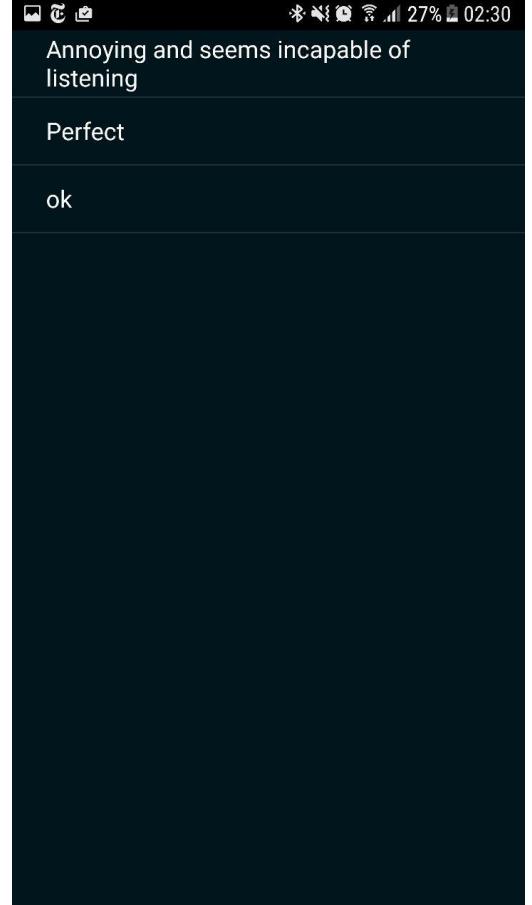

### GetUserDetails:

- Makes a call to the Web API and returns information about the user.

## See all reviews of helper

By clicking the see all reviews button, the user can see a simple list of all the reviews of a user, with no additional clutter around the review.

The only place that the user can go from here is back to the previous screen, by using the back buttons on the android device.

 <p>The screenshot shows a smartphone interface with a dark theme. At the top, there are several status icons: signal strength, battery level at 27%, and the time 02:30. Below the status bar, the screen displays a list of reviews for a helper. The reviews are listed vertically with horizontal lines between them. The first review says "Annoying and seems incapable of listening". The second review says "Perfect". The third review says "ok".</p>	<p><b>OnCreate:</b></p> <ul style="list-style-type: none"> <li>• Populates the ListView with the content from the array of reviews returned by GetListOfReviews (with parameter of the helperId)</li> </ul> <p><b>GetListOfReviews:</b></p> <ul style="list-style-type: none"> <li>• Sends request to the WebAPI with the helperId, and parses the JSON response into the array of reviews for that user.</li> </ul>
--	--

### Set time to book appointment

If they instead click to book an appointment with the helper, they are presented with a list of weeks which they can book appointments in. This interface is similar in style to the 'Set Timetable' interface, in this case with a few changes.

Firstly, the number of weeks they can book an appointment in, is reduced, from seven weeks to only the next four weeks. Additionally, the week will only appear if the helper has any time in that week. Otherwise, the week will simply not appear.

The user can click on any one of the weeks to move onto the next screen.

#### OnCreate:

- Populates the listview with the date of the weekbeginning date for the next several weeks in a readable way, first checking whether there are any appointments available in that week – using CheckIfAnyTimeInWeek.
  - To do this, it first gets the timetable of the user – using GetTimetableOfUser
  - Then, it checks if this week is one of the specific columns which are defined, if it is, then this week is used.
  - Otherwise, the default week is used.
  - This week is passed to the CheckIfAnyTimeInWeek function.

#### CheckIfAnyTimeInWeek:

- Returns false if and only if a checkIfAnyTimeInDay fails for all days in the week.

#### CheckIfAnyTimeInDay:

- Checks if there are any free times in the day – returns true if there are, false if not.

#### OnListItemClick:

- Starts the activity to choose the exact day to have the appointment, passing the weekbeginning date as a parameter and the weekId (the default week if it isn't a custom week in the timetable).

#### GetTimetableOfHelper:

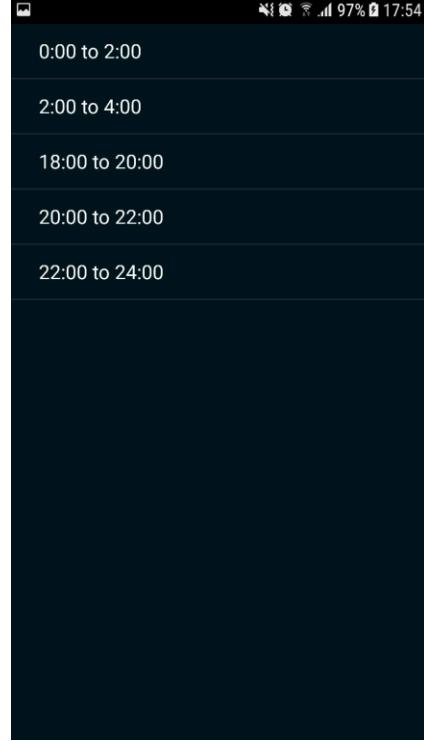

- Sends a request to the WebAPI with the parameter of the id of the timetableId and returns the timetable of the user.

Once the user has selected a week, they can then select a day from that week to have an appointment. In the same way as the week list, this is presented in a simple list, with only days which have free times being available to be clicked on.

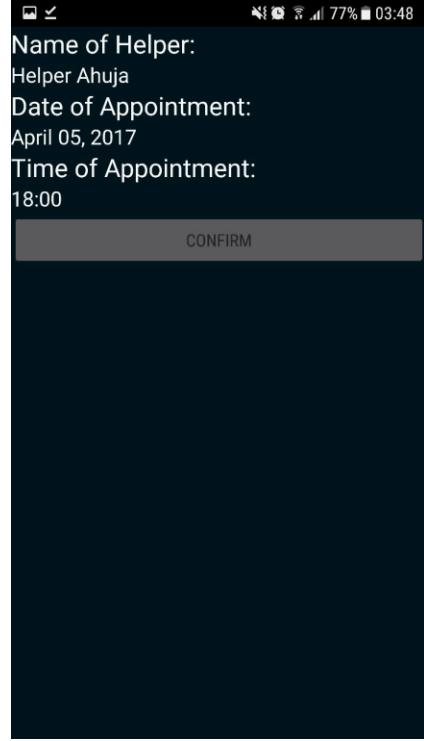

If any day is clicked, the user can then move onto the next screen, to select the time of the appointment.

	<p><b>OnCreate:</b></p> <ul style="list-style-type: none"><li>• Get the week to be displayed using the <code>GetWeek</code>.</li><li>• Populates the list view with all the days of the week – first checking if there is any time in that day before displaying it.</li><li>• Also checks if the day is before today before displaying it.</li></ul> <p><b>GetWeek:</b></p> <ul style="list-style-type: none"><li>• Sends request to the WebAPI and parses the JSON response into a week.</li></ul> <p><b>CheckIfTimeInDay:</b></p> <ul style="list-style-type: none"><li>• Given the day, checks if there is any free appointments in that day – returning a false if there are not, returning a true if there are.</li></ul> <p><b>OnListItemClick:</b></p> <ul style="list-style-type: none"><li>• Starts the activity of selecting the time of the appointment passing the <code>DateTime</code> of the selected day as well as the <code>dayId</code>.</li></ul>
--	--

In this screen, the user can select one of the available times to have the appointment, again being presented in a simple list.

	<p><b>OnCreate:</b></p> <ul style="list-style-type: none"> <li>Populated the list based on which appointments are available during the selected day (day got using the GetDay function).</li> </ul> <p><b>GetDay:</b></p> <ul style="list-style-type: none"> <li>Sends request to the WebAPI and parses the JSON response into a day.</li> </ul> <p><b>OnListItemClick:</b></p> <ul style="list-style-type: none"> <li>Starts the activity of the submission of the appointment screen, passing the exact date and time of the appointment as a parameter, as well as the helper and elderlyId.</li> </ul>
---	--

Finally, when this is selected, the complete information about the appointment is displayed, with the user then being able to book the appointment by pressing the 'Confirm' button.

	<p><b>OnCreate:</b></p> <ul style="list-style-type: none"> <li>Populates the screen with the details of the helper, using the GetUserDetails function and the details of the appointment passed from the previous activity.</li> </ul> <p><b>SubmitButtonClick:</b></p> <ul style="list-style-type: none"> <li>Creates an appointment object and POSTs this to the WebAPI.</li> <li>Displays a toast notification that the appointment has been created.</li> <li>Starts the Welcome screen on elderly with a sentBack parameter as true. <ul style="list-style-type: none"> <li>This then redirects the screen to the list of appointments with the welcome screen as the screen which is last in the stack of screens.</li> </ul> </li> </ul>
---	---

	<ul style="list-style-type: none"> <li>Therefore, if the back button is pressed, the welcome screen is returned to.</li> </ul> <p><b>GetUserDetails:</b></p> <ul style="list-style-type: none"> <li>Makes a call to the Web API and returns information about the user.</li> </ul>
--	--

### View appointments

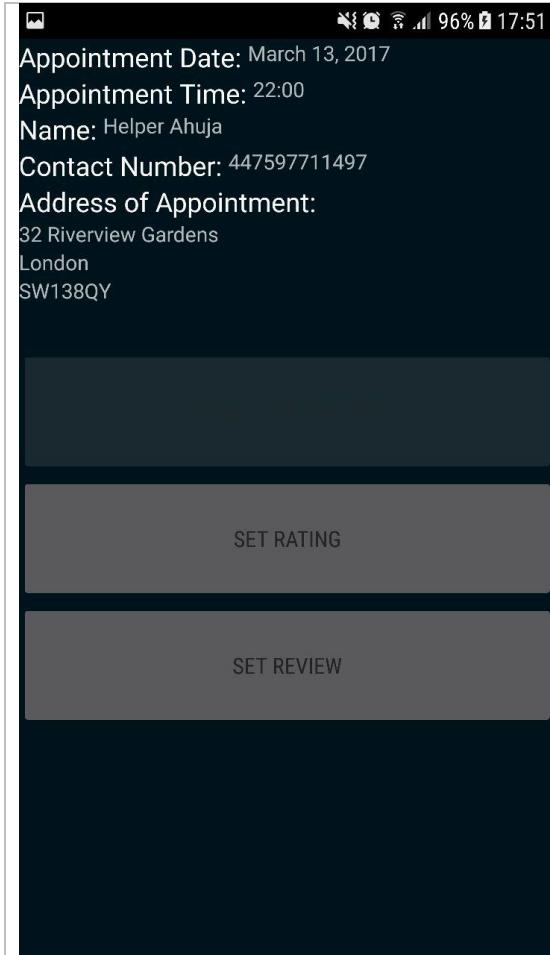

If, instead of booking an appointment at the main screen, the user clicked list of appointments, the user would be presented with a screen similar to this. This screen, identically to the 'list of appointments' screen for the helpers, displays all the appointments the elderly person has. These are arranged with the upcoming appointments first, before going into past appointments, latest first. For each appointment, the helper name and time and date is listed.

By clicking any one of the appointments, more details about the appointment can be retrieved.

	<p><b>OnCreate:</b></p> <ul style="list-style-type: none"> <li>Get list of appointments.</li> <li>Foreach of the appointments, get the name of the elderly person (using <code>getUserDetails</code>).</li> <li>Populate the list view in the order of upcoming first (closest first), then going back in history</li> </ul> <p><b>OnListItemClick:</b></p> <ul style="list-style-type: none"> <li>Call the activity to show more details about that appointment.</li> </ul> <p><b>returnListOfAppointments:</b></p> <ul style="list-style-type: none"> <li>From the helperId, this makes a call to the REST api and returns the list of appointments.</li> </ul> <p><b>getUserDetails:</b></p> <ul style="list-style-type: none"> <li>Makes a call to the Web API and returns information about the user.</li> </ul>
--	---

## See details of appointments

In this screen, as opposed to the helper equivalent, the only difference is the fact that the 'Set Rating' and 'Set Review' buttons are available to be pressed if the appointment has already occurred.

### OnCreate:

- GetAppointmentDetails of appointment to show in more details.
- Populate the text views using details from GetUserDetails
- If in the past, ensure that cancel appointment is not enabled. If in the future, it should be enabled.

### CancelAppointmentClick:

- Send the request to the Web API.

### GetUserDetails:

- Send request to Web API and return the user information.

### GetAppointmentDetails

- Send request to Web API and return the appointment.

### SetRatingClick:

- Starts the rating activity.

### SetReviewClick:

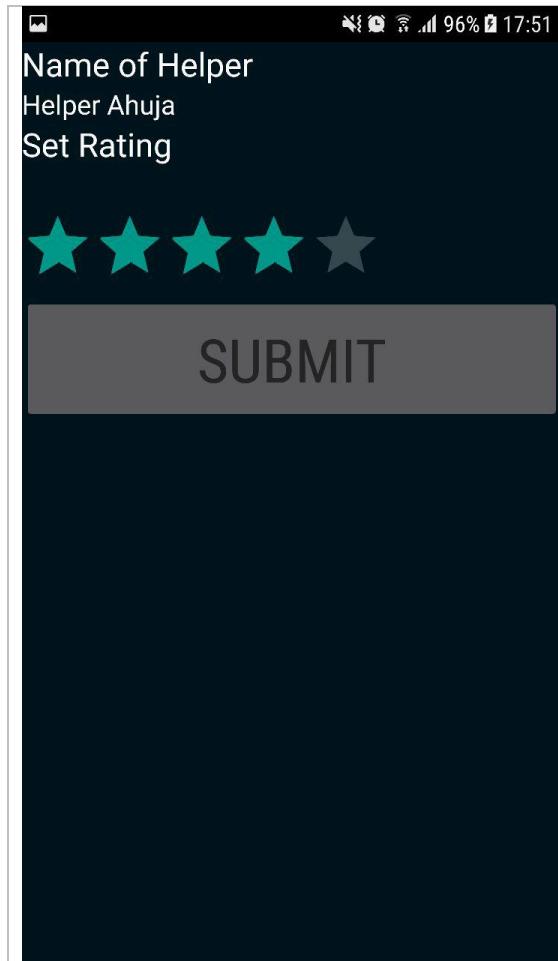

- Starts the review activity.

## Set rating

If the 'Set Rating' button is pressed, the user is taken to this screen, which allows them to set (or edit an existing) a rating. They do that by pressing on the desired location on the star – half stars are also possible. Therefore, they are effectively rating on a scale of 0 to 10.

When they first come to the screen, if a rating has already been added, the stars are prepopulated with this rating, otherwise they all appear empty.

By pressing the submit button, the rating is added to the database. The success of this addition is displayed by a toast notification which informs the user of this success.

#### OnCreate:

- The view is initialised and the name of the helper populated (using the GetUserDetails function).
- The rating is also populated by the GetRating function. If it has no rating, then it is populated as 0 stars. Otherwise, it gets the rating as it was given.

#### SubmitRatingClick:

- It is checked whether a rating exists or not.
- If one already exists, the new rating is POSTed to the WebAPI so that it can be updated on the database.
- If not, then it is sent to the WebAPI as a rating to be added, alongside the appointmentId, so the rating information can be added to the appointments table.
- Finally, a toast notification is used to tell the user that the rating has been submitted.

#### GetRating:

- The rating (based on the ratingId) is retrieved from the database, using a request from the WebAPI.

#### getUserDetails:

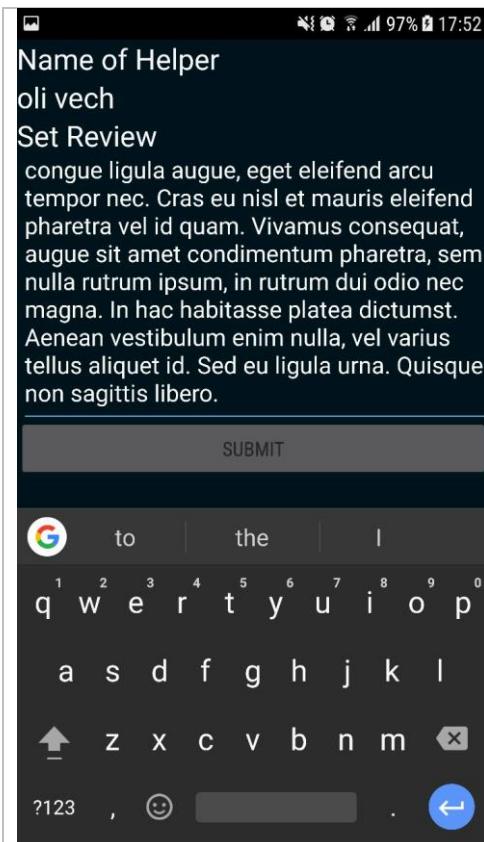

- Makes a call to the Web API and returns information about the user.

#### Set review

If the 'Set Review' button is pressed, the user is taken to this screen, which allows them to set (or edit an existing) a review. They do that by typing their review on the expanding textView, which allows them to write very long reviews if they so desire.

When they first come to the screen, if a review has already been added, the textView are prepopulated with this review, otherwise it appears empty.

By pressing the submit button, the review is added to the database. The success of this addition is displayed by a toast notification which informs the user of this success.

#### OnCreate:

- The view is initialised and the name of the helper populated (using the GetUserDetails function).
- The review is also populated by the GetReview function. If it has no review, then the review box is empty. Otherwise, it gets the review as it was given.

#### SubmitReviewClicked:

- It is checked whether a review exists or not.
- If one already exists, the new review is POSTed to the WebAPI so that it can be updated on the database.
- If not, then it is sent to the WebAPI as a review to be added, alongside the appointmentId, so the review information can be added to the appointments table.
- Finally, a toast notification is used to tell the user that the review has been submitted.

#### GetReview:

- The review (based on the reviewId) is retrieved from the database, using a request from the WebAPI.

#### getUserDetails:

- Makes a call to the Web API and returns information about the user.

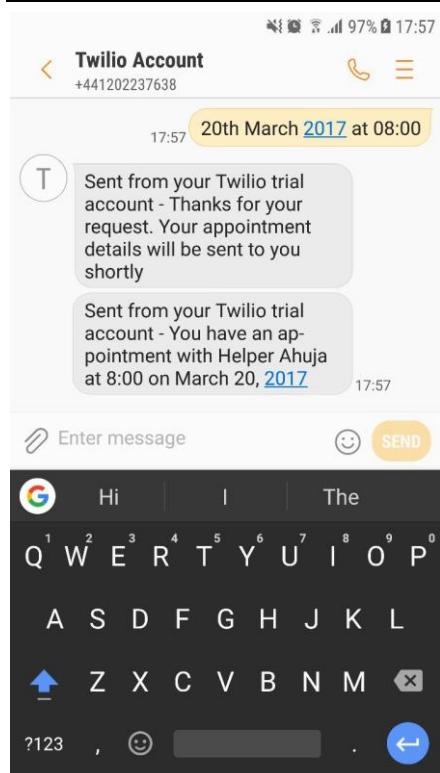

## 2.5 – SMS Server System

The SMS system relies upon the Twilio system which provides a phone number and an API through which text messages can be received and sent. In order to communicate with the Twilio REST API, the helper library is used with Python.

This has only one class, and consists of four functions:

1. “@app.route('/sms', methods = ['GET','POST'])”
  - a. This deals with incoming SMS messages and simply passes them onto the .NET core Web Api as well as sending a generic response: 'Thanks for your request. Your appointment details will be sent to you shortly'
2. “@app.route('/sendSms', methods = ['POST'])”
  - a. This deals with any messages to be sent to other number and passes them on, using the Twilio helper library, to be sent.
  - b. (This receives the required data in JSON, which it uses the Requests library to deal with)
3. “@app.route('/verifyNumber', methods = ['POST'])”
  - a. This deals with verifying a new phone number (so it can text the Twilio number and receive messages from it),
  - b. It POSTs lots of information to the Twilio REST API and receives a validation code which is then returned to the Android application.
4. “if \_\_name\_\_ == '\_\_main\_\_':”
  - a. This defines important things like the port number on which the API should be run.

Figure 14: Example of SMS Appointment Server in action (appointment allocated by .NET Core API)

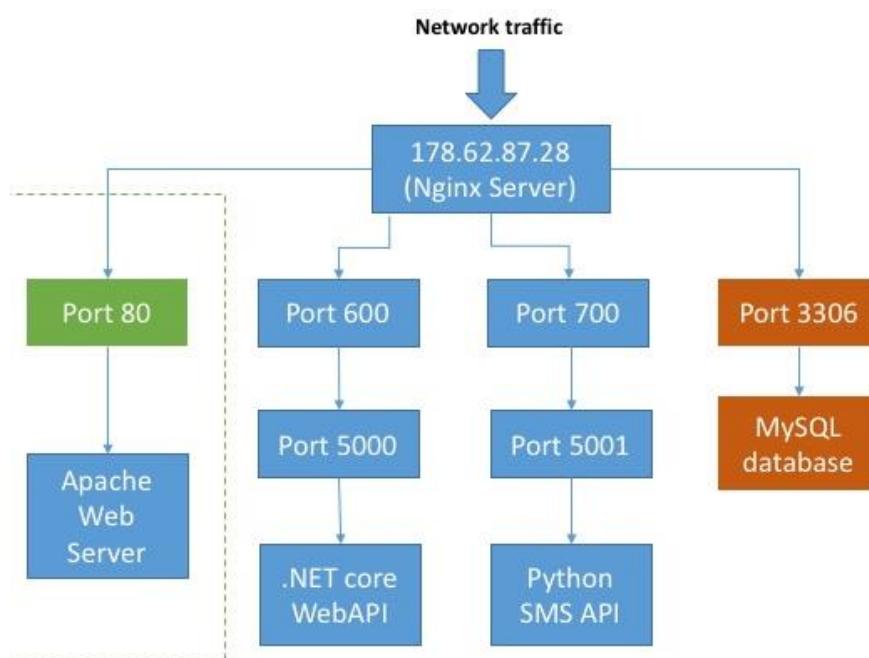

## 2.6 – Server Side Management

### 2.6.1 – Traffic Management

In order to ensure the server can respond to multiple sources of traffic, attempting to communicate with different APIs, an Nginx server was set up, with the config file being setup to have listeners on a number of different ports which can then forward the traffic to the correct open ports from the correct applications. This ensures that traffic from existing Apache Web Servers (which run multiple websites), the .NET core WebAPI and the Python SMS API can be dealt with individually. Additionally, the port for the database traffic can be configured such that only traffic from the localhost will be allowed. This is an effective safety mechanism to ensure that the database cannot be easily accessed and SQL commands cannot simply be run and the data retrieved from the database. Therefore, the network traffic route is therefore hence:

Figure 15: Network traffic diagram of server

### 2.6.2 – Crontabs

The other important aspect on the server side was ensuring that all the various APIs and the database ran at the same time. In fact, normally, even running a single one of them would not occur at the same time normally, as they each took focus over a console window. Therefore, by creating a bash script which would execute each of them in the background was required. This would carry out the console commands that would be otherwise required to run the programs to be bypassed, as simply running the bash script would run all these commands, while allowing all the APIs to run in the background.

In case the server ever went down – the provider often complete a number of scheduled maintenance sessions, another measure was taken to ensure that the APIs would restart and there would be no problems. By defining a crontab, a specific script could be run at a particular time. Therefore using a crontab which would run at startup, the bash script to startup the APIs could be run at startup, therefore meaning that the service of the APIs would be up again, after any issues.

## **2.7 – Testing Strategy**

The general aim of the testing is to test each part in turn, before testing the entirety of the system. Hence, the following test series were developed:

### **Test Series 1: Testing the Web API (Black-Box Testing)**

In order to test the WebAPI, the requests from the Android App will be spoofed, using Postman, which allows one to send HTTP requests to each of the HTTP functions

The testing of the WebAPI gets further split into testing the following:

<b>Test Series Number</b>	<b>Purpose of Test Series</b>
<b>1.1</b>	Test SQL command class
<b>1.2</b>	Test DateTime Parsing
<b>1.3</b>	Test HTTP GET (get it to send commands to a computer which will process and log the requests)
<b>1.4</b>	Test Accounts controller
<b>1.5</b>	Test AccountsForHelper controller
<b>1.6</b>	Test AccountsForElderly controller
<b>1.7</b>	Test Appointments controller
<b>1.8</b>	Test Ratings controller
<b>1.9</b>	Test Reviews controller
<b>1.10</b>	Test Timetable controller

### **Test Series 2: Testing the Python SMS Server API (Black-Box Testing)**

In order to test the Python SMS Server, the tests can be triggered by a combination of SMS messages from a phone and using Postman to trigger the API functions.

<b>Test Series Number</b>	<b>Purpose of Test Series</b>
<b>2.1</b>	Test GET on '/'
<b>2.2</b>	Test SMS receipt on /SMS
<b>2.3</b>	Test /sendSMS
<b>2.4</b>	Test /verifyNumber

### **Test Series 3: Testing the Android Application**

In order to test the Android Application, the flow of the android app is tested, ensuring that buttons send the application to correct places.

<b>Test Series Number</b>	<b>Purpose of Test Series</b>
<b>3.1</b>	Test ‘Login or Register’ screen
<b>3.2</b>	Test ‘Login’ screen
<b>3.3</b>	Test ‘Register’ screen
<b>3.4</b>	Test ‘List of Appointments’ screen
<b>3.5</b>	Test ‘Appointment Details’ screen
<b>3.6</b>	Test ‘Ratings submit’ screen
<b>3.7</b>	Test ‘Review submit’ screen
<b>3.8</b>	Test ‘Helper details’ screen
<b>3.9</b>	Test ‘See reviews’ screen
<b>3.10</b>	Test ‘Book appointment weeks’ screen
<b>3.11</b>	Test ‘Book appointment days’ screen
<b>3.12</b>	Test ‘Book appointment times’ screen
<b>3.13</b>	Test ‘Book details confirm’ screen
<b>3.14</b>	Test ‘Appointment details (helper)’ screen
<b>3.15</b>	Test ‘Set Timetable’ screen
<b>3.16</b>	Test ‘Set Timetable days’ screen
<b>3.17</b>	Test ‘Set Timetable times’ screen
<b>3.18</b>	Test ‘Welcome Elderly’ screen
<b>3.19</b>	Test ‘Welcome Helper’ screen
<b>3.20</b>	Test ‘Book Appointment – List of nearby helpers’ screen

### **Test Series 4: Full system testing**

Since much of this data relies upon data which is not static, it is hard to have tests which have set results, since the results will vary based on when the test is completed. Therefore, it is important that the results are generally reasonably easy to verify by using an application with a GUI to look at the raw data in the database and ensure that things like the timetable point to correct days. The application which is being used for this is HeidiSQL.

<b>Test Series Number</b>	<b>Purpose of Test Series</b>
<b>4.1</b>	Test registering
<b>4.2</b>	Test logging in
	<b>ElderlyTests</b>
<b>4.4</b>	Test list of appointments
<b>4.5</b>	Test one appointment
<b>4.6</b>	Test rating
<b>4.7</b>	Test review
	<b>ElderlyTests.BookAppointment</b>
<b>4.9</b>	Test list of helpers
<b>4.10</b>	Test helper details
<b>4.11</b>	Test book appointment
<b>4.12</b>	<b>General UI Testing</b>
<b>4.13</b>	Test SMS appointment creation system
	<b>HelperTests</b>
<b>4.14</b>	Test set timetable (and subsequently booking appointments)
<b>4.17</b>	<b>General UI Testing</b>

### 3 – Implementation

See the appendices for the code.

## 4 – Testing

### 4.1 – Test Series 1

Test Number	Purpose / Description	Test Data	Reason	Expected Result	Passed
<b>1.1</b>	<b>Test SQLCommand Class</b>				
<b>1.1.1</b>	Test general SELECT from database	<b>T1.1.1</b>	Normal Data	<b>E1.1.1</b>	Yes
<b>1.1.2</b>	Test incorrect syntax SELECT	<b>T1.1.2</b>	Erroneous Data	<b>E1.1.2</b>	Yes
<b>1.1.3</b>	Test SELECT of ungettable data in database	<b>T1.1.3</b>	Erroneous Data	<b>E1.1.2</b>	Yes
<b>1.1.4</b>	Test UPDATE query on database.	<b>T1.1.4</b>	Normal Data	<b>E1.1.3</b>	Yes
<b>1.2</b>	<b>Test DateTime Parsing</b>				
<b>1.2.1</b>	Test parsing with valid date and time	<b>T1.2.1</b>	Normal Data	<b>E1.2.1</b>	Yes
<b>1.2.2</b>	Test parsing with keyword 'tomorrow'	<b>T1.2.2</b>	Normal Data	<b>E1.2.2</b>	Yes
<b>1.2.3</b>	Test parsing text without time	<b>T1.2.3</b>	Boundary Data	<b>E1.2.3</b>	Yes
<b>1.2.4</b>	Test parsing text without date	<b>T1.2.4</b>	Boundary Data	<b>E1.2.4</b>	Yes
<b>1.2.5</b>	Test parsing text with correct date and time with American date format format	<b>T1.2.5</b>	Normal Data	<b>E1.2.5</b>	Yes
<b>1.3</b>	<b>Test HTTP GET</b>				
<b>1.3.1</b>	Test with correct HTTP GET	<b>T1.3.1</b>	Normal Data	<b>E1.3.1</b>	Yes
<b>1.3.2</b>	Test with incorrect URL HTTP GET	<b>T1.3.2</b>	Erroneous Data	<b>E1.3.2</b>	Yes

<b>1.3.3</b>	Test with incorrect URL HTTP GET	<b>T1.3.3</b>	Erroneous Data	<b>E1.3.3</b>	Yes
<b>1.4</b>	<b>Test Accounts controller</b>				
<b>1.4.1</b>	Test "Hello World" function	<b>T1.4.1</b>	Normal Data	<b>E1.4.1</b>	Yes
<b>1.4.2</b>	Test add new user function	<b>T1.4.2</b>	Normal Data	<b>E1.4.2</b>	Yes
<b>1.4.3</b>	Test verify new user function	<b>T1.4.3</b>	Normal Data	<b>E1.4.3</b>	Yes
<b>1.5</b>	<b>Test AccountsForHelper controller</b>				
<b>1.5.1</b>	Test "Hello World" function	<b>T1.5.1</b>	Normal Data	<b>E1.5.1</b>	Yes
<b>1.5.2</b>	Test GetInfo function with correct id	<b>T1.5.2</b>	Normal Data	<b>E1.5.2</b>	Yes
<b>1.5.3</b>	Test GetInfo using an incorrect id	<b>T1.5.3</b>	Erroneous Data	<b>E1.5.3</b>	Yes
<b>1.5.4</b>	Test AddNewUser with new unique information.	<b>T1.5.4</b>	Normal Data	<b>E1.5.4</b>	Yes
<b>1.5.5</b>	Test AddNewUser with email address which already exists in database.	<b>T1.5.5</b>	Erroneous Data	<b>E1.5.5</b>	Yes
<b>1.5.6</b>	Test Delete user with correct userId.	<b>T1.5.6</b>	Normal Data	<b>E1.5.6</b>	Yes
<b>1.5.7</b>	Test Delete userwith incorrect userid.	<b>T1.5.7</b>	Erroneous Data	<b>E1.5.7</b>	Yes
<b>1.5.8</b>	Test update user success (using correct id)	<b>T1.5.8</b>	Normal Data	<b>E1.5.8</b>	Yes
<b>1.5.9</b>	Test update user failure (using incorrect id)	<b>T1.5.9</b>	Erroneous Data	<b>E1.5.9</b>	Yes
<b>1.5.10</b>	Test verifyUser using a wrong password	<b>T1.5.10</b>	Normal Data	<b>E1.5.10</b>	Yes

<b>1.5.11</b>	Test verifyUser correct information (existing account)	<b>T1.5.11</b>	Normal Data	<b>E1.5.11</b>	Yes
<b>1.5.12</b>	Test GetListOfUsersByDistance using a correct user account	<b>T1.5.12</b>	Normal Data	<b>E1.5.12</b>	Yes
<b>1.5.13</b>	Test GetListOfUsersByDistance with an incorrect user id.	<b>T1.5.13</b>	Erroneous Data	<b>E1.5.13</b>	Yes
<b>1.6</b>	<b>Test AccountsForElderly controller</b>				
<b>1.6.1</b>	Test "Hello World" function	<b>T1.6.1</b>	Normal Data	<b>E1.6.1</b>	Yes
<b>1.6.2</b>	Test GetInfo with correct id	<b>T1.6.2</b>	Normal Data	<b>E1.6.2</b>	Yes
<b>1.6.3</b>	Test GetInfo with incorrect id	<b>T1.6.3</b>	Erroneous Data	<b>E1.6.3</b>	Yes
<b>1.6.4</b>	Test AddNewUser with unique information	<b>T1.6.4</b>	Normal Data	<b>E1.6.4</b>	Yes
<b>1.6.5</b>	Test AddNewUser with already existing information	<b>T1.6.5</b>	Erroneous Data	<b>E1.6.5</b>	Yes
<b>1.6.6</b>	Test Delete of valid user	<b>T1.6.6</b>	Normal Data	<b>E1.6.6</b>	Yes
<b>1.6.7</b>	Test Delete of invalid user	<b>T1.6.7</b>	Erroneous Data	<b>E1.6.7</b>	Yes
<b>1.6.8</b>	Test update success (correct id)	<b>T1.6.8</b>	Normal Data	<b>E1.6.8</b>	Yes
<b>1.6.9</b>	Test update failure (incorrect id)	<b>T1.6.9</b>	Erroneous Data	<b>E1.6.9</b>	Yes
<b>1.6.10</b>	Test verifyUser wrongPassword	<b>T1.6.10</b>	Normal Data	<b>E1.6.10</b>	Yes
<b>1.6.11</b>	Test verifyUser with correct information	<b>T1.6.11</b>	Normal Data	<b>E1.6.11</b>	Yes
<b>1.7</b>	<b>Test Appointments controller</b>				

<b>1.7.1</b>	Test create new SMS impossible because there are no available appointments.	<b>T1.7.1</b>	Boundary Data	<b>E1.7.1</b>	Yes
<b>1.7.2</b>	Test create new SMS with correct phone number and available appointment time.	<b>T1.7.2</b>	Normal Data	<b>E1.7.2</b>	Yes
<b>1.7.3</b>	Test create new SMS from unrecognised number	<b>T1.7.3</b>	Erroneous Data	<b>E1.7.3</b>	Yes
<b>1.7.4</b>	Test sendSMS function, sending SMS to verified number.	<b>T1.7.4</b>	Normal Data	<b>E1.7.4</b>	Yes
<b>1.7.5</b>	Test createNewAppointmentsForAndroid App with valid appointment information, with availability at that time.	<b>T1.7.5</b>	Normal Data	<b>E1.7.5</b>	Yes
<b>1.7.6</b>	Test GetAppointmentInformation failure, using an incorrect appointment id.	<b>T1.7.6</b>	Erroneous Data	<b>E1.7.6</b>	Yes
<b>1.7.7</b>	Test GetAppointmentInformation success, using correct appointment id.	<b>T1.7.7</b>	Normal Data	<b>E1.7.7</b>	Yes
<b>1.7.8</b>	Test RemoveAppointment on an incorrect appointment id.	<b>T1.7.8</b>	Erroneous Data	<b>E1.7.8</b>	Yes
<b>1.7.9</b>	Test RemoveAppointment success, using a correct appointment id.	<b>T1.7.9</b>	Normal Data	<b>E1.7.9</b>	Yes
<b>1.7.10</b>	Test AppointmentsByElderly with an incorrect elderlyId.	<b>T1.7.10</b>	Erroneous Data	<b>E1.7.10</b>	Yes
<b>1.7.11</b>	Test AppointmentsByElderly with a correct elderlyId.	<b>T1.7.11</b>	Normal Data	<b>E1.7.11</b>	Yes
<b>1.7.12</b>	Test AppointmentsByHelper with an incorrect helperId.	<b>T1.7.12</b>	Erroneous Data	<b>E1.7.12</b>	Yes
<b>1.7.13</b>	Test AppointmentsByHelper correctId	<b>T1.7.13</b>	Normal Data	<b>E1.7.13</b>	Yes

<b>1.8</b>	<b>Test Ratings controller</b>				
<b>1.8.1</b>	Test GetAllRatingsForHelper with valid helperId.	<b>T1.8.1</b>	Normal Data	<b>E1.8.1</b>	Yes
<b>1.8.2</b>	Test GetAllRatingsForHelper with invalid helperId.	<b>T1.8.2</b>	Erroneous Data	<b>E1.8.2</b>	Yes
<b>1.8.3</b>	Test GetOneSpecificRating with correct ratingId.	<b>T1.8.3</b>	Normal Data	<b>E1.8.3</b>	Yes
<b>1.8.4</b>	Test GetOneSpecificRating with incorrectId.	<b>T1.8.4</b>	Erroneous Data	<b>E1.8.4</b>	Yes
<b>1.8.5</b>	Test AddARating with correct rating information	<b>T1.8.5</b>	Normal Data	<b>E1.8.5</b>	Yes
<b>1.8.6</b>	Test UpdateRating with correct rating information	<b>T1.8.6</b>	Normal Data	<b>E1.8.6</b>	Yes
<b>1.8.7</b>	Test DeleteRating with correct rating id.	<b>T1.8.7</b>	Normal Data	<b>E1.8.7</b>	Yes
<b>1.9</b>	<b>Test Reviews controller</b>				
<b>1.9.1</b>	Test GetAllReviewsForHelper with correct review id.	<b>T1.9.1</b>	Normal Data	<b>E1.9.1</b>	Yes
<b>1.9.2</b>	Test GetAllReviewsForHelper with correct helperId.	<b>T1.9.2</b>	Erroneous Data	<b>E1.9.2</b>	Yes
<b>1.9.3</b>	Test GetOneSpecificReview with correct review id.	<b>T1.9.3</b>	Normal Data	<b>E1.9.3</b>	Yes
<b>1.9.4</b>	Test GetOneSpecificReview with incorrect reviewId.	<b>T1.9.4</b>	Erroneous Data	<b>E1.9.4</b>	Yes
<b>1.9.5</b>	Test AddAReview with valid review.	<b>T1.9.5</b>	Normal Data	<b>E1.9.5</b>	Yes
<b>1.9.6</b>	Test UpdateReview with valid review.	<b>T1.9.6</b>	Normal Data	<b>E1.9.6</b>	Yes
<b>1.9.7</b>	Test DeleteReview with valid review id.	<b>T1.9.7</b>	Normal Data	<b>E1.9.7</b>	Yes
<b>1.10</b>	<b>Test Timetable controller</b>				

<b>1.10.1</b>	Test AddTimetable with valid timetable.	<b>T1.10.1</b>	Normal Data	<b>E1.10.1</b>	Yes
<b>1.10.2</b>	Test GetTimetable with valid timetableId.	<b>T1.10.2</b>	Normal Data	<b>E1.10.2</b>	Yes
<b>1.10.3</b>	Test GetTimetable with incorrect timetableId.	<b>T1.10.3</b>	Erroneous Data	<b>E1.10.3</b>	Yes
<b>1.10.4</b>	test getWeek fail with incorrect weekId.	<b>T1.10.4</b>	Erroneous Data	<b>E1.10.4</b>	Yes
<b>1.10.5</b>	Test getWeek success with correct weekId.	<b>T1.10.5</b>	Normal Data	<b>E1.10.5</b>	Yes
<b>1.10.6</b>	Test GetDay success with correct dayId.	<b>T1.10.6</b>	Normal Data	<b>E1.10.6</b>	Yes
<b>1.10.7</b>	Test GetDay fail with invalid dayId.	<b>T1.10.7</b>	Erroneous Data	<b>E1.10.7</b>	Yes

## 4.2 – Test Series 2

Test Number	Purpose / Description	Test Data	Reason	Expected Result	Passed
<b>2.1.1</b>	Test GET on '/'	<b>T2.1.1</b>	Normal Data	<b>E2.1.1</b>	Yes
<b>2.2.1</b>	Test SMS receipt from validated number	<b>T2.2.1</b>	Normal Data	<b>E2.2.1</b>	Yes
<b>2.2.2</b>	Test SMS receipt from invalidated number	<b>T2.2.2</b>	Boundary Data	<b>E2.2.2</b>	Yes
<b>2.3.1</b>	Test /sendSMS with correct information and valid number.	<b>T2.3.1</b>	Normal Data	<b>E2.3.1</b>	Yes
<b>2.3.2</b>	Test /sendSMS to invalidated number	<b>T2.3.2</b>	Erroneous Data	<b>E2.3.2</b>	Yes
<b>2.3.3</b>	Test /sendSMS with no body	<b>T2.3.3</b>	Boundary Data	<b>E2.3.3</b>	Yes

<b>2.3.4</b>	Test /sendSMS with different phone format	<b>T2.3.4</b>	Boundary Data	<b>E2.3.4</b>	Yes
<b>2.3.5</b>	Test /sendSMS with incorrect phone number	<b>T2.3.5</b>	Erroneous Data	<b>E2.3.5</b>	Yes
<b>2.3.6</b>	Test /sendSMS without correct information	<b>T2.3.6</b>	Erroneous Data	<b>E2.3.6</b>	Yes
<b>2.4.1</b>	Test /verifyNumber using correct information	<b>T2.4.1</b>	Normal Data	<b>E2.4.1</b>	Yes
<b>2.4.2</b>	Test /verifyNumber without correct information	<b>T2.4.2</b>	Erroneous Data	<b>E2.4.2</b>	Yes

#### 4.3 – Test Series 3

Test Number	Purpose / Description	Test Data	Reason	Expected Result	Passed
<b>3.1</b>	<b>Test ‘Login or Register’ screen</b>				
<b>3.1.1</b>	Test clicking login button	<b>T3.1.1</b>	Normal Data	<b>E3.1.1</b>	Yes
<b>3.1.2</b>	Test clicking register button	<b>T3.1.2</b>	Normal Data	<b>E3.1.2</b>	Yes
<b>3.2</b>	<b>Test ‘Login’ screen</b>				
<b>3.2.1</b>	Test clicking back button	<b>T3.2.1</b>	Normal Data	<b>E3.2.1</b>	Yes
<b>3.2.2</b>	Test registering with incomplete fields in registration screen.	<b>T3.2.2</b>	Erroneous Data	<b>E3.2.2</b>	Yes

<b>3.3</b>	<b>Test ‘Register’ screen</b>				
<b>3.3.1</b>	Test registering with incomplete fields in registration screen.	<b>T3.3.1</b>	Erroneous Data	<b>E3.3.1</b>	Yes
<b>3.3.2</b>	Test registering with incomplete fields in registration screen.	<b>T3.3.2</b>	Erroneous Data	<b>E3.3.2</b>	Yes
<b>3.3.3</b>	Test registering with incomplete fields in registration screen.	<b>T3.3.3</b>	Erroneous Data	<b>E3.3.3</b>	Yes
<b>3.3.4</b>	Test registering with incomplete fields in registration screen.	<b>T3.3.4</b>	Erroneous Data	<b>E3.3.4</b>	Yes
<b>3.3.5</b>	Test registering with incomplete fields in registration screen.	<b>T3.3.5</b>	Erroneous Data	<b>E3.3.5</b>	Yes
<b>3.3.6</b>	Test registering with incomplete fields in registration screen.	<b>T3.3.6</b>	Erroneous Data	<b>E3.3.6</b>	Yes
<b>3.3.7</b>	Test registering with incomplete fields in registration screen.	<b>T3.3.7</b>	Erroneous Data	<b>E3.3.7</b>	Yes
<b>3.3.8</b>	Test registering with incomplete fields in registration screen.	<b>T3.3.8</b>	Erroneous Data	<b>E3.3.8</b>	Yes
<b>3.3.9</b>	Test registering with incomplete fields in registration screen.	<b>T3.3.9</b>	Erroneous Data	<b>E3.3.9</b>	Yes
<b>3.3.10</b>	Test registering with incomplete fields in registration screen.	<b>T3.3.10</b>	Erroneous Data	<b>E3.3.10</b>	Yes
<b>3.3.11</b>	Test registering with passwords not matching	<b>T3.3.11</b>	Erroneous Data	<b>E3.3.11</b>	Yes
<b>3.3.12</b>	Test clicking back button	<b>T3.3.12</b>	Normal Data	<b>E3.3.12</b>	Yes

<b>3.4</b>	<b>Test 'List of Appointments' screen</b>				
<b>3.4.1</b>	Test clicking on an appointment	<b>T3.4.1</b>	Normal Data	<b>E3.4.1</b>	Yes
<b>3.4.2</b>	Test clicking back button	<b>T3.4.2</b>	Normal Data	<b>E3.4.2</b>	Yes
<b>3.5</b>	<b>Test 'Appointment Details' screen</b>				
<b>3.5.1</b>	Test clicking back button	<b>T3.5.1</b>	Normal Data	<b>E3.5.1</b>	Yes
<b>3.5.2</b>	Test clicking set rating button.	<b>T3.5.2</b>	Normal Data	<b>E3.5.2</b>	Yes
<b>3.5.3</b>	Test clicking set review button.	<b>T3.5.3</b>	Normal Data	<b>E3.5.3</b>	Yes
<b>3.6</b>	<b>Test 'Ratings submit' screen</b>				
<b>3.6.1</b>	Test clicking back button	<b>T3.6.1</b>	Normal Data	<b>E3.6.1</b>	Yes
<b>3.7</b>	<b>Test 'Review submit' screen</b>				
<b>3.7.1</b>	Test clicking back button	<b>T3.7.1</b>	Normal Data	<b>E3.7.1</b>	Yes
<b>3.8</b>	<b>Test 'Helper details' screen</b>				
<b>3.8.1</b>	Test clicking see reviews button.	<b>T3.8.1</b>	Normal Data	<b>E3.8.1</b>	Yes
<b>3.8.2</b>	Test clicking book appointment button.	<b>T3.8.2</b>	Normal Data	<b>E3.8.2</b>	Yes
<b>3.9</b>	<b>Test 'See reviews' screen</b>				
<b>3.9.1</b>	Test clicking back button	<b>T3.9.1</b>	Normal Data	<b>E3.9.1</b>	Yes
<b>3.10</b>	<b>Test 'Book appointment weeks' screen</b>				

<b>3.10.1</b>	Test clicking back button	<b>T3.10.1</b>	Normal Data	<b>E3.10.1</b>	Yes
<b>3.10.2</b>	Test clicking on week.	<b>T3.10.2</b>	Normal Data	<b>E3.10.2</b>	Yes
<b>3.11</b>	<b>Test 'Book appointment days' screen</b>				
<b>3.11.1</b>	Test clicking back button	<b>T3.11.1</b>	Normal Data	<b>E3.11.1</b>	Yes
<b>3.11.2</b>	Test clicking on day.	<b>T3.11.2</b>	Normal Data	<b>E3.11.2</b>	Yes
<b>3.12</b>	<b>Test 'Book appointment times' screen</b>				
<b>3.12.1</b>	Test clicking back button	<b>T3.12.1</b>	Normal Data	<b>E3.12.1</b>	Yes
<b>3.12.2</b>	Test clicking on a timeslot.	<b>T3.12.2</b>	Normal Data	<b>E3.12.2</b>	Yes
<b>3.13</b>	<b>Test 'Book details confirm' screen</b>				
<b>3.13.1</b>	Test back button	<b>T3.13.1</b>	Normal Data	<b>E3.13.1</b>	Yes
<b>3.14</b>	<b>Test 'Appointment details confirm' screen</b>				
<b>3.14.1</b>	Test back button	<b>T3.14.1</b>	Normal Data	<b>E3.14.1</b>	Yes
<b>3.15</b>	<b>Test 'Set timetable' screen</b>				
<b>3.15.1</b>	Test back button	<b>T3.15.1</b>	Normal Data	<b>E3.15.1</b>	Yes
<b>3.15.2</b>	Test clicking on a week.	<b>T3.15.2</b>	Normal Data	<b>E3.15.2</b>	Yes
<b>3.16</b>	<b>Test 'Set timetable days' screen</b>				

<b>3.16.1</b>	Test back button	<b>T3.16.1</b>	Normal Data	<b>E3.16.1</b>	Yes
<b>3.16.2</b>	Test clicking on day (for appointment to be created).	<b>T3.16.2</b>	Normal Data	<b>E3.16.2</b>	Yes
<b>3.17</b>	<b>Test 'Set Timetable times' screen</b>				
<b>3.17.1</b>	Test clicking back button	<b>T3.17.1</b>	Normal Data	<b>E3.17.1</b>	Yes
<b>3.18</b>	<b>Test 'Welcome Elderly' screen</b>				
<b>3.18.1</b>	Test clicking list of appointments button.	<b>T3.18.1</b>	Normal Data	<b>E3.18.1</b>	Yes
<b>3.18.2</b>	Test clicking book appointment button.	<b>T3.18.2</b>	Normal Data	<b>E3.18.2</b>	Yes
<b>3.19</b>	<b>Test 'Welcome Helper' screen</b>				
<b>3.19.1</b>	Test clicking set timetable button.	<b>T3.19.1</b>	Normal Data	<b>E3.19.1</b>	Yes
<b>3.19.2</b>	Test clicking list of appointments button.	<b>T3.19.2</b>	Normal Data	<b>E3.19.2</b>	Yes
<b>3.20</b>	<b>Test 'Book Appointment – List of nearby helpers' screen</b>				
<b>3.20.1</b>	Test clicking helper on list of helpers screen.	<b>T3.20.1</b>	Normal Data	<b>E3.20.1</b>	Yes
<b>3.20.2</b>	Test clicking back button.	<b>T3.20.2</b>	Normal Data	<b>E3.20.2</b>	Yes

#### 4.4 – Test Series 4

Test Number	Purpose / Description	Test Data	Reason	Expected Result	Passed
<b>4.1</b>	<b>Test Registering</b>				

<b>4.1.1</b>	Test registering (using correct details) and ensure that Twilio verification can occur successfully.	<b>T4.1.1</b>	Normal Data	<b>E4.1.1</b>	Yes
<b>4.1.2</b>	Test registering without a valid internet connection.	<b>T4.1.2</b>	Boundary Data	<b>E4.1.2</b>	Yes
<b>4.2</b>	<b>Test logging in</b>				
<b>4.2.1</b>	Test logging in without a valid internet connection.	<b>T4.2.1</b>	Boundary Data	<b>E4.2.1</b>	Yes
<b>4.2.2</b>	Test logging in without a correct password.	<b>T4.2.2</b>	Boundary Data	<b>E4.2.2</b>	Yes
<b>4.2.3</b>	Test logging in with a correct username and password.	<b>T4.2.3</b>	Normal Data	<b>E4.2.3</b>	Yes
<b>4.2.4</b>	Test logging in on a device which has previously logged in – i.e. test whether it autlogs in.	<b>T4.2.4</b>	Normal Data	<b>E4.2.4</b>	Yes
<b>4.4</b>	<b>Test list of appointments</b>				
<b>4.4.1</b>	Test viewing all appointments and verify that they all exist and are ordered correctly.	<b>T4.4.1</b>	Normal Data	<b>E4.4.1</b>	Yes
<b>4.5</b>	<b>Test one appointment</b>				
<b>4.5.1</b>	Test viewing more information about one appointment and verify that information about the appointment is correct.	<b>T4.5.1</b>	Normal Data	<b>E4.5.1</b>	Yes
<b>4.5.2</b>	Test viewing an appointment which has taken place in the past and verify that you are able to set reviews and ratings and are unable to cancel the appointment.	<b>T4.5.2</b>	Normal Data	<b>E4.5.2</b>	Yes
<b>4.5.3</b>	Test viewing an upcoming appointment and verify the ability to cancel the appointment. Also, ensure that it is impossible to set reviews and ratings.	<b>T4.5.3</b>	Normal Data	<b>E4.5.3</b>	Yes
<b>4.6</b>	<b>Test rating</b>				

<b>4.6.1</b>	Test setting a rating and ensure that the updating of the rating works through a shift in the average rating as well as through the rating existing when it is attempted to be changed again.	<b>T4.6.1</b>	Normal Data	<b>E4.6.1</b>	Yes
<b>4.7</b>	<b>Test review</b>				
<b>4.7.1</b>	Test setting a review for an appointment and ensure that the review is added by checking the reviews of the helper in the book appointment system.	<b>T4.7.1</b>	Normal Data	<b>E4.7.1</b>	Yes
<b>4.9</b>	<b>Test list of helpers</b>				
<b>4.9.1</b>	Test viewing a list of nearby helpers on an account with a faulty postcode.	<b>T4.9.1</b>	Erroneous Data	<b>E4.9.1</b>	Yes
<b>4.9.2</b>	Test viewing a list of nearby helpers (in the book appointment system) on an account with a valid postcode and verify the list is correct.	<b>T4.9.2</b>	Normal Data	<b>E4.9.2</b>	Yes
<b>4.10</b>	<b>Test helper details</b>				
<b>4.10.1</b>	Test viewing a single helper (from the list of nearby helpers) and ensure the data is valid about the helper.	<b>T4.10.1</b>	Normal Data	<b>E4.10.1</b>	Yes
<b>4.10.2</b>	Test see reviews about a single helper and ensure the reviews are valid.	<b>T4.10.2</b>	Normal Data	<b>E4.10.2</b>	Yes
<b>4.11</b>	<b>Test book appointment</b>				
<b>4.11.1</b>	Test the ability to only book appointments in the future – i.e. attempt to book an appointment in the past.	<b>T4.11.1</b>	Erroneous Data	<b>E4.11.1</b>	Yes
<b>4.11.2</b>	Try to book appointment on a day with no available appointments (as set from set timetable side on helper).	<b>T4.11.2</b>	Boundary Data	<b>E4.11.2</b>	Yes
<b>4.11.3</b>	Test successfully booking an appointment and verifying that is shows on list of appointments.	<b>T4.11.3</b>	Normal Data	<b>E4.11.3</b>	Yes

<b>4.11.4</b>	Test book an appointment and then cancel it (from the list of appointments), and check it gets cancelled.	<b>T4.11.4</b>	Normal Data	<b>E4.11.4</b>	Yes
<b>4.11.5</b>	Test cancelling an appointment from list of appointments and check it no longer appears on list of appointments when the list is refreshed.	<b>T4.11.5</b>	Normal Data	<b>E4.11.5</b>	Yes
<b>4.13</b>	<b>Test SMS appointment creation system</b>				
<b>4.13.1</b>	Test sending a text with correct information and ensure that an appointment is created and the details of this are received by text.	<b>T4.13.1</b>	Normal Data	<b>E4.13.1</b>	Yes
<b>4.13.2</b>	Test sending a text message with incorrect information (i.e. no valid date and time) and ensure that the correct error text message is received.	<b>T4.13.2</b>	Erroneous Data	<b>E4.13.2</b>	Yes
<b>4.13.3</b>	Test sending an SMS to create an appointment when no helpers are free – therefore testing whether the correct ‘no helpers could be found’ error text message is received.	<b>T4.13.3</b>	Boundary Data	<b>E4.13.3</b>	Yes
<b>4.14</b>	<b>Test set timetable (and subsequently booking appointments)</b>				
<b>4.14.1</b>	Test setting timetable and see if changes by reloading the same day and seeing if changes prevail.	<b>T4.14.1</b>	Normal Data	<b>E4.14.1</b>	Yes
<b>4.14.2</b>	Test setting a helper’s timetable and see if you can book an appointment from an helper account and check the available times are the same as those set.	<b>T4.14.2</b>	Normal Data	<b>E4.14.2</b>	Yes

#### 4.12 and 4.17

In order to attempt to complete test 4.12 and 4.17, the applications were placed into the hands of two random users (different to the end users), with a bare minimum explanation to see if they could

complete the following tasks (determined as they tested all the important features of the application and would be enough for them to successfully have an appointment):

#### *Elderly App*

1. Create an account
2. Book an appointment with a nearby helper tomorrow after looking at the helper's rating and reviews.
3. Cancel the appointment.
4. Book another appointment tomorrow.
5. (At this point, the raw data was altered by changing the data in the database (this is not accessible to the user) and the appointment changed to be in the past)
6. Rate the helper.
7. Review the helper.
8. Book an appointment with an SMS message for two days time at 12pm.

#### *Helper App*

1. Create an account
2. Set the timetable to reasonable hours for the next two weeks.
3. (At this point an appointment was created with the user using another device)
4. Cancel the newly created appointment.

Both test users managed to complete all tasks with no additional assistance, so the tests can be deemed to be successful.

## 5 – Evaluation

Objective	Objective met?	Details
<b>1 - Input</b>		
<b>There must be an Android app, which works with all Android phones with software later than Android Ice Cream Sandwich (4.0).</b>	Yes	Though the application has only been tested to be working above Android 5.0 (due to a lack of test devices), it has been simulated at lower device versions (including 4.0) and has been working.
<b>The elderly person should also be able to create an appointment with an SMS messages to a specified phone number.</b>	Yes	Tests 4.13 show that this system is working.
<b>The SMS should only require the user to send a Date and Time and the information about the appointment should be communicated directly back to the user over SMS.</b>	Yes	Tests 4.13 show that the system works when a date and time is sent over SMS and successfully returns errors when not all data is present.  4.13.1 shows the receipt of the information of an appointment.
<b>To log onto the Android application, the system should remember the password of the user once they have logged in once, thereby allowing them to not need to remember the password.</b>	Yes	Test 4.2.4 shows that the autologin system ensures that users do not need to log onto the system multiple times on the same device.
<b>2 - User Interface (on all systems)</b>		
<b>The screens should be as simple as possible, removing unnecessary information to other screens if necessary.</b>	Yes	Test 4.12 shows that the interface is very simple as a person with little instruction is able to use it.  Additionally, having given it to an elderly neighbour at a few points throughout the development, he now

		believes it is at a point at which anybody can use the system with little to no training.
<b>As a maximum, there should be two possible (very different) paths to follow from every screen, with the difference in what each button does being marked clearly.</b>	Yes	Looking at the design shows that there are never more than two different paths through the application at one time – with the exception of ListViews, where each lead to the same path, just with different data.
<b>All text should be large, above 12pt, to ensure that the elderly person can see it easily, with worse eye-sight.</b>	Yes	Looking at the code, it is clear to see that all text is at least of size 12pt.
<b>There should be a screen where the user will be able to scroll through the nearby teenagers who can provide tech support.</b>	Yes	This is the 'Book Appointment' screen, shown in section 2.4.3 and tested in 4.9.2.
<b>This screen should be organised by how near the helper is, therefore meaning that the helper is unlikely to have to travel from very far.</b>	Yes	This is tested and shown to be working in test 4.9.2.
<b>For each teenager, the elderly person should be able to see their average rating (if they have been rated), location and all of their reviews.</b>	Yes	The average rating is visible in the 'Book Appointment' screen (2.4.3), while the 'See Reviews' screen is described in 2.4.3 and tested in 4.10.2
<b>The user should be able to look at the various appointments a teenager has free, allowing them to choose a time which would suit them.</b>	Yes	The user can view the times that the helpers are free over the next four weeks, therefore being able to choose whichever one of them suits the elderly person best.
<b>They should be able to book an appointment for any available time at least within the next two weeks.</b>	Yes	They can in fact pick any appointment within the next four weeks.

<b>The user should be able to see the list of upcoming and past appointments, seeing the details about the appointment.</b>	Yes	They can see all this information in the ‘List of Appointments’ screen, described in 2.4.2 and tested in 4.4.1.
<b>For appointments in the past, the user should be able to rate and review the helper, therefore helping future elderly people to decide whether the helper would be able to help them.</b>	Yes	Designed in 2.4.3 and tested in 4.5.2 vs 4.5.3.
<b>For appointments in the future, the user should be able to cancel the appointment, if they are no longer free.</b>	Yes	This was designed in 2.4 and tested in 4.5.4
<b>3 – Teenager’s Input</b>		
<b>There must be an Android app through which the person should be able to interact with the system.</b>	Yes	There is an android app which has been designed in section 2.4 and tested in section 4.
<b>There should be a system to ensure to remember the password for the android application, so that they would not have to remember the password every time they log onto the application.</b>	Yes	Test 4.2.4 shows that the autologin system ensures that users do not need to log onto the system multiple times on the same device.
<b>4 – Teenager’s User Interface</b>		
<b>The user must be able to see everyone who has requested their help.</b>	Yes	They can see all this information in the ‘List of Appointments’ screen, described in 2.4.2 and tested in 4.4.1.
<b>They should be able to cancel any appointments which they are no longer able to be available for.</b>	Yes	This was designed in 2.4 and tested in 4.5.4
<b>The user should also be able to define when they are free</b>	Yes	This ability was designed in 2.4.2 and tested in 4.14. The application allows

<b>for the next six weeks, allowing them to set the times that they would be free for appointments.</b>		the user to set their times that they are free for the next eight weeks, firstly choosing the week to edit, then the day and finally choosing the times that they are free for that day.
<b>5 - The appointments should be two hours in length for all appointments.</b>	Yes	As throughout the design and in the implementation, the appointments are designed to be two hours long, running between even hours.
<b>6 - The payment should be defined as £20 per hour for the appointments, therefore being £20 if the appointment takes up less than half the appointment slot, or £40 otherwise.</b>	Yes	The payment, while not being discussed throughout the app has been defined to be £20 per hour and this should be discussed in any user manual.
<b>7 - The system should be secure, with passwords hashed to ensure that they are not easy to utilise in case the server is hacked.</b>	Yes	The passwords are hashed with MD5, see section 2.3.3

## 5.1 – User Feedback

### 5.1.1 – Mrs Wilson (AgeUK)

Mrs Wilson, on being shown the completed system, immediately found the system incredibly impressive, finding that it had not only met the specification that had been defined but most importantly that the system was very well designed, being aesthetically pleasing for both the elderly and the helpers.

In showing Mrs Wilson the system, I largely focused on the elderly side, as this was the part of the specification which she had helped to define. Upon picking up the application for the first time, she mentioned that the system was very easy to use, and could easily be used by any members of the elderly that she taught without too much trouble.

During the registration process, the only part which she found poorly documented and difficult to understand was the Twilio verification step, since if the elderly person left the code screen too quickly or failed to get the call the first time, then there was no method by which this could be resolved. She commented that it would be useful to have the opportunity to do this within the logged in section.

Another comment she made was the lack of a ‘forgot my password’ section which would be incredibly useful if an elderly person forgets their password. However, she particularly liked the autologin features (which we hadn’t previously discussed) finding that this feature makes the lack of a ‘forgot my password’ section far more acceptable. She also commented that biometrics on newer phones could be another feature which could be integrated to further reduce the amount of work elderly people would have to do.

Within the logged in section, she again loved the simplicity, with each screen having a well-defined purpose. She was somewhat surprised that I had managed to keep to her guideline of a maximum of two separate things on a single screen. She particularly enjoyed the booking system which she found very intuitive – with plenty of messages to the user wherever necessary but offering a simple process.

She commented on a problem that an elderly person could book an appointment with someone who was miles away. She recommended therefore, at the very least, the distance could be displayed for the elderly person to see – since this is already calculated in the backend.

Another minor issue she had found was that found the time delay in finding the nearest helpers was rather longer than she would have liked and therefore, if possible, this could be reduced. However, for the rest of the interface, she found it to be very snappy and without any latency.

A final discussion we had was based on the use of the word elderly throughout the application. She commented that it would likely disintervise users from using the application as people are likely to prefer not to think they are elderly. Though I had considered and dismissed the problem having talked to my elderly neighbours, Mrs Wilson felt it was important that I reassess this. She also mentioned that the application had also reached a point that it was not only useful for the elderly, instead would be useful for a much wider range of people. Therefore, by simply changing the

terminology, for example using ‘client’ or ‘customer’ instead of elderly, I could attract a larger audience, as well as making my current audience able to use the application with less uneasiness.

Overwhelmingly however, the feedback was positive and she was excited for the possibilities for the application. She was already discussing how it could be rolled out to help elderly people around the country, and was excited to show this to some of the elderly people who she taught in the elderly technical support classes she ran.

### 5.1.2 – Phil Fernandes

Phil largely found that the system was exceedingly effective and easily met his requirements. He commented on the ease of use of the system, saying that anyone could definitely use the helper side of the software, which, though not a particularly important a thing (this was not a specification point), is always a positive.

He says the interface is intuitive and easy to use, as long as there is a little bit of understanding with regards to what the application does. Therefore, if the application were to be more broadly launched, it would be useful to produce a ‘User Manual’ or something to this effect which could briefly show how to use the application.

He mentioned that the one area where he anticipated that problems may have arisen from, the setting of the timetable and booking of timetables has an effective interface, by allowing the users to first choose the week, then the day and then edit the hour or book an appointment at a particular hour.

He said that there were a few possible issues which could be addressed is simplifying this process even more might be useful, attempting to bring in a calendar-esque interface, rather than this approach. Though perhaps harder to produce, the calendar approach would allow for more effective usage of the application.

He also mentioned that the aspect of no maximum distance for each helper user being unhelpful and something which should be added if there were to be time.

## 5.2 – Analysis

### 5.2.1 – Learnability

Throughout the process, the easy of use of the application by the elderly has been foremost in my mind, with a number of tests throughout the programming, to ensure that the application could be used by a random person without any instruction. This culminated in test 4.12, which shows that someone, given little to no instruction, can perform a set of tasks with the application. This, alongside the comments by Mrs Wilson and Phil seem to vindicate this effort as they all mention that they find it very easy to use and therefore usable by all elderly people without any issues.

However, even given this, it would almost certainly be useful, before the product were to be released, to produce a User Manual to outline the various things the application can do and outline how they can be done.

The User Manual would also offer an opportunity to shine a light on two areas where the least information is provided to users, payment and the SMS messaging system. At no point in the

application is payment discussed, despite a fixed fee system having been decided in the Analysis. In the application however, there is no correct page where this information would fit. Additionally, the exact format for SMS messages to be sent by the elderly person to the server and the phone number to send them to is not properly defined and could be easily made mistakes on. Though not a particularly complex issue, not a challenging one to talk about, it would be an important thing to mention in any user manual.

### 5.2.2 – Latency

Mrs Wilson complained that there was too much of a time lag in the transition between two screens, the login screen and the welcome screen (for the elderly) and between the welcome screen and ‘Book Appointment’ (i.e. the list of nearby helpers) screen.

For the login screen, the time lag is almost certainly down to the time taken by the MD5 hashing algorithm. The MD5 algorithms gets its impressive security by being vastly complex an algorithm and therefore this conversion inevitably will take some time. Additionally, since this is only likely to be completed once every time the app is used, this seems acceptable.

For the book appointment screen, it seems far more a consequence of the speed of the Google Maps API, since it returns lots of information, including the route between the two points, traffic, etc. Since all I need in fact, is a longitude and latitude for each point, and then the distance can be calculated using Haversine Formula, this should be saved in the database and calculated upon registration. Alternatively, another API, such as the OpenMaps API could be used instead for simpler results. Another important matter to consider when considering the solution is that if this were to be scaled up, there might be problems due to the number of calls made to the Google Maps API – which limits this to ten per second, unless you pay for the paid account.

### 5.2.3 – Improvements

In order to improve the system, it would be better to store the location of each helper as a longitude and latitude in the database as this would allow for a much faster sorting of the system.

Additionally, it would be better to make use of a more significant Natural Language processing system, since the one I am currently using is very specific as to the information it requires to work. For example, if a year is not specified when the entirety of a date is specified then it assumes the date is today’s date, rather than parsing the rest of the date and assuming the year is this year (the far more logical assumption). Additionally, it relies upon the user abiding by a specific timing format (HH:MM). If I had used a library like IBM Watson’s inbuilt NLP API, it would be able to deal with all formats, in addition to dealing with things like ‘quarter past’ etc which are substituted instead of the time. It would also continue to work even if there are a few spelling mistakes, something which currently prevents the system from parsing the date.

Finally, throughout the system, references to the elderly should be removed, instead being replaced by ‘client’ or ‘customer’, thereby attracting a wider target market and ensuring those who may still have technical problems, but do not regard themselves as elderly, could still use the application.

### 5.2.4 – Extensions

#### iOS Applications

The first extension would be to ensure that the application could be produced for iOS to ensure that elderly people and teenagers with iOS phones and tablets could also use the system.

In fact, since the Android application was produced using Xamarin, this shouldn't pose too much of a challenge as the vast majority of the code could be reused if the application for iOS were to be coded in Xamarin iOS.

### **Tablet Specific Application**

Another extension would be to produce a tablet specific application, especially catering to cheap Android tablets, which have proved very successful with the elderly people, according to Mrs Wilson. Though the application as it currently stands can be used on a tablet (and has been informally tested on a Nexus 7 tablet), the system should be redesigned to cater for the larger screen and the added functionality which can be gotten from this.

### **Variable time-slot appointments**

As mentioned by Phil, another change that could be made is introducing variable length appointments or offering a number of possible lengths. This would increase the efficiency of the process as the teenagers could help more elderly people in the same amount of time. This would be especially important when the elderly person knows the problem would be quick to solve but can't solve it themselves.

### **Maximum travelable distance for helpers**

The current solution has no method to stop elderly people booking appointments with teenagers who live hours, or even further, away. Therefore, if a maximum distance decision could be added when the helper signs up for an account, this can be taken into account into whether to display their account in the 'Book an Appointment' view for a specific elderly person, by simply comparing this decided maximum distance with the distance between the helper and the elderly person.

a = caller_id ['validation_code']
return a # returns the validation code

if __name__ == '__main__': # Entry point for application
    app.debug=True #Allows things to be printed to the screen
    app.run(port=5001) # Begins the listener
```

## Appendix D – Test Data and Expected Results

### Test Series 1

#### 1.1

##### T1.1.1

SELECT \* FROM accountsForElderly WHERE id = 1

##### E1.1.1

Check that correct field is displayed – looking at the SQL GUI application

```
SELECT * FROM accountsForElderly WHERE id = 1
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| id | username | emailAddress | password | firstname | surname | firstlineOfAddress | secondlineOfAddress | telephoneNumber | postalCode | city | country | timetableId |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 1 | ahujaas | ashwin@gmail.co | ash | ahu | aj | a | a | W23LRP | a | a | a | NULL |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
1 rows in set
```

##### T1.1.2

SELECT notAField FROM accountsForElderly WHERE id = 1

##### E1.1.2

```
SELECT notAField FROM accountsForElderly WHERE id = 1
Error: Query execution failed: Unknown column 'notAField' in 'field list'
```

##### T1.1.3

SELECT \* FROM accountsForElderly WHERE id = 1008

##### E1.1.3

```
SELECT * FROM accountsForElderly WHERE id = 1008
```

Empty set

##### T1.1.4

UPDATE accountsForElderly SET username = "ahujaa" WHERE id = 1

##### E1.1.4

```
UPDATE accountsForElderly SET username = "ahujaa" WHERE id = 1
Query OK, 1 rows affected
```

#### 1.2

##### T1.2.1

"27th April 2016 at 10:00"

##### E1.2.1

27/04/2016 10:00

##### T1.2.2

"tomorrow at 20:00"

E1.2.2

01/04/2017 20:00:00

T1.2.3

"27th April 2017 at an undefined time"

E1.2.3

27/04/2017 00:00:00

T1.2.4

"10:00"

E1.2.4

31/03/2017 10:00:00

T1.2.5

"3/30/2017 12:00"

E1.2.5

30/03/2017 12:00:00

**1.3**

T1.3.1

GET http://localhost:5000/api/ac

E1.3.1

"Hello World"

T1.3.2

GET http://localNOThost:5000/api/ac

E1.3.2

Could Not Get A Response

T1.3.3

GET http://localhost:5000/api/ac22

E1.3.3

404 Not Found

T1.4.1

GET http://localhost:5000/api/ac

E1.4.1

"Hello World"

T1.4.2

POST http://localhost:5000/api/ac/users/ad

## Parameters

```
"{  
    ""id"": 0,  
    ""username"": ""testUsername"",
    ""firstName"": ""testFirstName"",
    ""surname"": ""testSurname"",
    ""password"": ""testPassword"",
    ""emailAddress"": ""testEmailAddress"",
    ""firstLineOfAddress"": ""testFirstLineOfAddress"",
    ""secondLineOfAddress"": ""testSecondLineOfAddress"",
    ""telephoneNumber"": ""testTelephoneNumber"",
    ""postalCode"": ""testPostcode"",
    ""city"": ""testCity"",
    ""country"": ""testCountry"",
    ""helper"": false,
    ""timetableId"": 1,
    ""distance"": 1.7976931348623157e+308
}  
"
```

E1.4.2

true

&

Check if new entry in elderly person database with entered properties

T1.4.3

POST http://localhost:5000/api/ac/users/vf

## Parameters

```
"{  
    ""password"": ""testPassword"",
    ""emailAddress"": ""testEmailAddress"",
    ""name"": ""testName"",
    ""surname"": ""testSurname"",
    ""middleName"": """",
    ""title"": """",
    ""dateOfBirth"": ""2010-01-01T00:00:00Z"",
    ""gender"": ""M"",
    ""nationality"": """",
    ""religion"": """",
    ""ethnicGroup"": """",
    ""language"": """",
    ""timetableId"": 1,
    ""distance"": 1.7976931348623157e+308
}  
"
```

```
    """helper"": false
```

```
}
```

#### E1.4.3

The details of the verified user should be returned in JSON, as below:

```
"{
```

```
    """id"": 34,
```

```
    """username"": ""testUsername""",
```

```
    """firstName"": ""testFirstName""",
```

```
    """surname"": ""testSurname""",
```

```
    """password"": ""testPassword""",
```

```
    """emailAddress"": ""testEmailAddress""",
```

```
    """firstLineOfAddress"": ""testFirstLineOfAddress""",
```

```
    """secondLineOfAddress"": ""testSecondLineOfAddress""",
```

```
    """telephoneNumber"": ""testPhoneNumber""",
```

```
    """postalCode"": ""testPostcode""",
```

```
    """city"": ""testCity""",
```

```
    """country"": ""testCountry""",
```

```
    """helper"": false,
```

```
    """timetableId"": 0,
```

```
    """distance"": 1.7976931348623157e+308
```

```
}
```

    ""emailAddress"": ""NEW EMAIL ADDRESS VERSION TWO"",
    ""helper"": false  
}"
```

### E1.6.11

The information of the verified user should be returned in JSON, for example, like this:

```
"{  
    ""id"": 20,  
    ""username"": ""ahujaas"",
    ""firstName"": ""Ashwin"",
    ""surname"": ""Ahuja"",
    ""password"": ""3ea7121feb7564ddfe2d1f2ebb41706e"",
    ""emailAddress"": ""NEW EMAIL ADDRESS VERSION TWO"",
    ""firstLineOfAddress"": ""32 Riverview Gardens"",
    ""secondLineOfAddress"": """",
    ""telephoneNumber"": ""NEW TELEPHONE NUMBER VERSION TWO"",
    ""postalCode"": ""SW138QY"",
    ""city"": ""London"",
    ""country"": ""United Kingdom"",
    ""helper"": false,
    ""timetableId"": 0,
    ""distance"": 1.7976931348623157e+308  
}"
```

### 1.7

#### T1.7.1

POST http://localhost:5000/api/app/sms+447597711495,20th April 2017 at 10:00

&

Ensure that there is no helper which is free at 10am on 20<sup>th</sup> April 2017 (by going into the timetable of each and changing it to false at that time)

E1.7.1

FALSE

&

SMS received saying "Nobody could be found."

T1.7.2

POST http://localhost:5000/api/app/sms+447597711495,9th April 2017 at 00:00

E1.7.2

TRUE

&

SMS received saying "You have an appointment with ... at 10:00 on 9th April 2017"

T1.7.3

POST http://localhost:5000/api/app/sms+44797711495,21st April 2017 at 00:00

&

Ensure that the number (+447597711495) is removed from the all elderly accounts.

E1.7.3

FALSE

&

No SMS received

T1.7.4

PUT http://localhost:5000/api/app/sendSMS

#### Parameters

```
"{  
    ""Body"": ""Hello Test Send"",  
    ""From"": ""+447597711495""  
}"
```

E1.7.4

TRUE

&

SMS received

T1.7.5

GET http://localhost:5000/api/app/gi1008

E1.7.5

An empty appointment is returned in JSON form.

```
{"  
    ""id"": 0,  
    ""helperId"": null,  
    ""elderlyId"": null,  
    ""dateAndTime"": null,  
    ""dateCreated"": null,  
    ""ratingId"": 0,  
    ""reviewId"": 0  
}
```

T1.7.6

GET http://localhost:5000/api/app/gi71

E1.7.6

An appointment (filled in) is returned in JSON form.

```
{"  
    ""id"": 71,  
    ""helperId"": 10,  
    ""elderlyId"": 20,  
    ""dateAndTime"": ""2017-03-15T02:00:00"",  
    ""dateCreated"": ""2017-03-13T13:34:01"",  
    ""ratingId"": 0,  
    ""reviewId"": 0  
}
```

T1.7.7

DELETE http://localhost:5000/api/app/re18

E1.7.7

FALSE

T1.7.8

DELETE http://localhost:5000/api/app/re71

E1.7.8

TRUE

&

Appointment deleted on database

T1.7.9

GET http://localhost:5000/api/app/gae1008

E1.7.9

An empty list is returned in JSON form.

[]

T1.7.10

GET http://localhost:5000/api/app/gae20

E1.7.10

A JSON array containing all the appointments of user 20 will be returned.

```

]"
```

#### T1.8.2

GET http://localhost:5000/api/ratings/ga1008

#### E1.8.2

An empty JSON array will be returned.

```
[]
```

#### T1.8.3

GET http://localhost:5000/api/ratings/go8

#### E1.8.3

The rating will be returned in JSON form.

```
{
    """id"": 8,
    """starRating"": 6,
    """helperId"": 9
}"
```

#### T1.8.4

GET http://localhost:5000/api/ratings/go72

#### E1.8.4

HTTP 500 Server Error

#### T1.8.5

POST http://localhost:5000/api/ratings/ar

#### Parameters

```
{
    """id"": 63,
    """starRating"": 10,
    """helperId"": 9
}"
```

#### E1.8.5

TRUE

&

Check rating is added to the database.

T1.8.6

PATCH http://localhost:5000/api/ratings/ud

#### Parameters

```
"{  
    ""id"": 63,  
    ""starRating"": 10,  
    ""helperId"": 9  
}"
```

E1.8.6

TRUE

&

Check the item is updated on the database.

T1.8.7

DELETE http://localhost:5000/api/ratings/rm10

E1.8.7

TRUE

&

Check item is removed from the database

1.9

T1.9.1

GET http://localhost:5000/api/reviews/ga9

E1.9.1

All reviews of helper id 9 are returned as a JSON array.

```
[  
{  
    ""id"": 6,  
    ""helperId"": 9,  
    ""comment"": "Annoying and seems incapable of listening"
```

```
},
{
    "id": 7,
    "helperId": 9,
    "comment": "Perfect"
},
{
    "id": 10,
    "helperId": 9,
    "comment": "ok"
}
```

#### T1.9.2

GET <http://localhost:5000/api/reviews/ga1008>

#### E1.9.2

An empty JSON array will be returned.

[]

#### T1.9.3

GET <http://localhost:5000/api/reviews/go8>

#### E1.9.3

A review will be returned in JSON form.

```
{
    "id": 8,
    "helperId": 10,
    "comment": "Imperfect"
}
```

#### T1.9.4

GET <http://localhost:5000/api/reviews/go72>

#### E1.9.4

HTTP 500 Server Error

T1.9.5

POST http://localhost:5000/api/reviews/ar

**Parameters**

```
"{  
    ""id"": 83,  
    ""helperId"": 10,  
    ""comment"": ""Now entirely perfect""  
}
```

E1.9.5

TRUE

&

Check review added to the database

T1.9.6

PATCH http://localhost:5000/api/reviews/ud

**Parameters**

```
"{  
    ""id"": 8,  
    ""helperId"": 10,  
    ""comment"": ""Now entirely perfect""  
}
```

E1.9.6

TRUE

&

Check review changed in database

T1.9.7

DELETE http://localhost:5000/api/ratings/rm15

E1.9.7

TRUE

&

Check review removed from the database

## 1.10

### T1.10.1

#### E1.10.1

Check timetable added to the database

#### T1.10.2

GET <http://localhost:5000/api/tt/gt16>

#### E1.10.2

A timetable will be returned in JSON form – this is hard to confirm as being correct without deserialising using C# Newtonsoft.

## Test Series 2

### 2.1

#### T2.1.1

GET http://178.62.87.28:700/

#### E2.1.1

"Hello World"

### 2.2

#### T2.2.1

SMS to twilio phone number from verified number

#### Parameters

"Hello World Test From Validated Number"

#### E2.2.1

HTTP GET request from the SMS server at "http://localhost:5000/api/app/sms+447597711495,Hello World Test From Validated Number"

#### T2.2.2

SMS to twilio phone number from number not verified on twilio

#### Parameters

"Hello World Test From Not Validated Number"

#### E2.2.2

No result

### 2.3

#### T2.3.1

POST http://178.62.87.28:700/sendSms

#### Parameters

"{

""From"": ""447597711495""",

""Body"": """Hello World SMS Receipt"""

}"

#### E2.3.1

"SUCCESS"

&

SMS received by phone.

T2.3.2

POST http://178.62.87.28:700/sendSms

**Parameters**

```
"{  
    ""From"": ""447824461022""",  
    ""Body"": ""Hello World SMS Receipt""  
}"
```

E2.3.2

"SUCCESS"

&

SMS not received

T2.3.3

POST http://178.62.87.28:700/sendSms

**Parameters**

```
"{  
    ""From"": ""447597711495"""  
    ""Body"": """"  
}"
```

E2.3.3

HTTP 400 Error: Message Body Required

T2.3.4

POST http://178.62.87.28:700/sendSms

**Parameters**

```
"{  
    ""From"": ""07597711495"""  
    ""Body"": ""Hello World SMS Receipt""  
}"
```

E2.3.4

"SUCCESS"

&

SMS received

T2.3.5

POST http://178.62.87.28:700/sendSms

**Parameters**

```
"{  
    ""From"": ""011495"",  
    ""Body"": ""Hello World SMS Receipt""  
}"
```

E2.3.5

HTTP 400 error: The 'To' number 011495 is not a valid phone number.

&

SMS not received

T2.3.6

POST http://178.62.87.28:700/sendSms

**Parameters**

```
"{  
    ""From"": ""011495"",  
}"
```

E2.3.6

HTTP 400 Error: Bad Request

&

SMS not received

2.4

T2.4.1

POST http://178.62.87.28:700/verifyNumber

**Parameters**

```
"{  
    ""Number"": ""447597711495'',  
    ""friendlyName"":""Ashwin Ahuja''  
}  
"
```

E2.4.1

789608

&

Subsequently able to verify number with code (responding to Twilio phone call) and check on Twilio Console (online)

T2.4.2

POST http://178.62.87.28:700/verifyNumber

#### Parameters

```
"{  
    ""Number"": ""447495'',  
    ""friendlyName"":""Ashwin Ahuja''  
}  
"
```

E2.4.2

HTTP 400 error: The phone number you are attempting to call, 447495, is not valid.

&

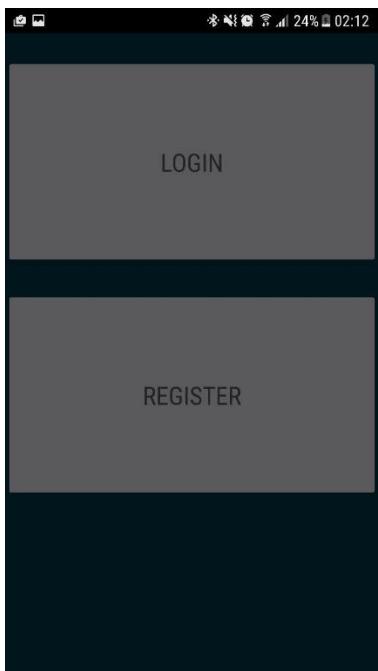

No verification of number

### Test Series 3

3.1

T3.1.1

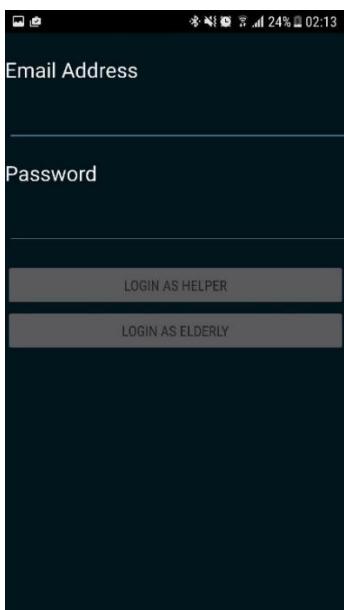

**Starting Screen:**

**Action:** Click the “login” button.

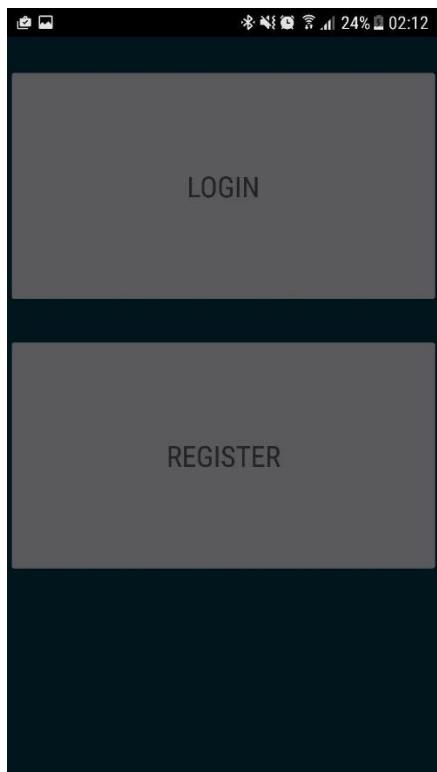

#### E3.1.1

The login screen (as below) should appear. If there is already a user which has been signed in on this phone, then the phone may login automatically.

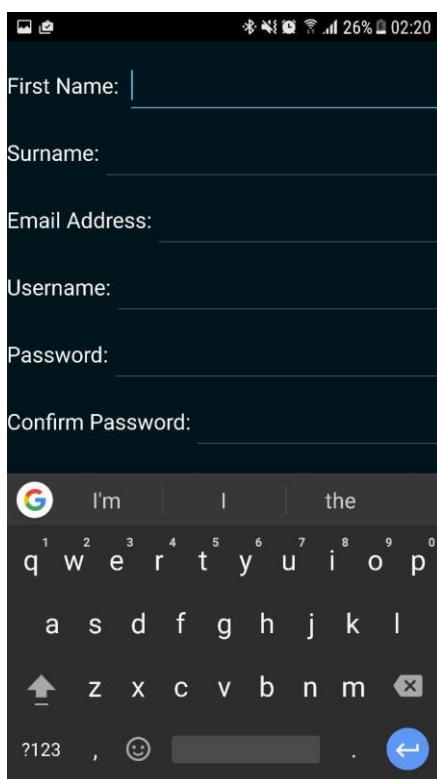

#### T3.1.2

**Starting Screen:**

**Action:** Click the “Register” button.

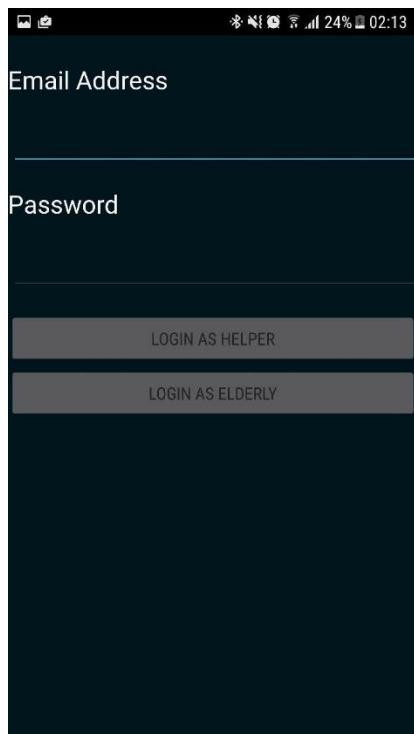

### E3.1.2

### 3.2

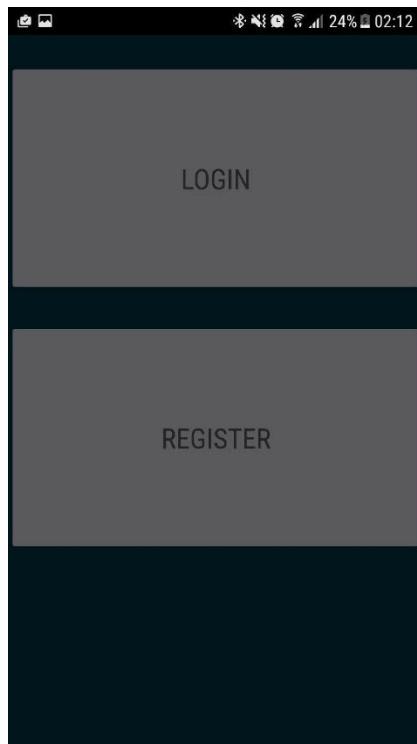

#### T3.2.1

**Starting Screen:**

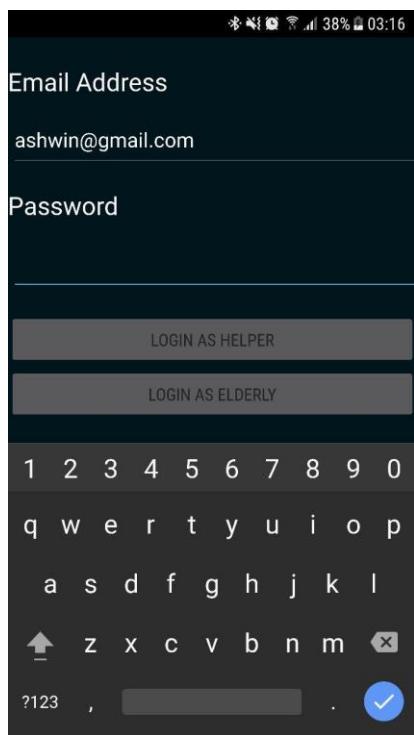

**Action:** Press “back” button

#### E3.2.1

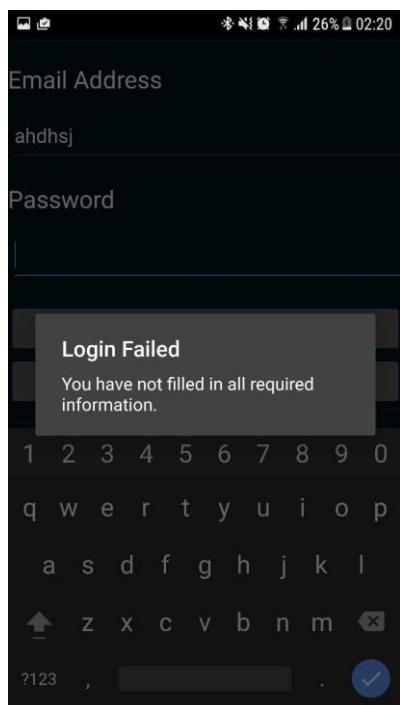

### T3.2.2

#### Starting Screen:

**Action:** Only email address added with no password entered. Then, the “Login as Helper” button is pressed.

### E3.2.2

### 3.3

#### T3.3.1

##### Starting State:

Email Address: email

Username: username

Password: .....

Confirm Password: .....

First Line of Address: firstline

Second Line of Address: secondline

City: city

Country: country

Postal Code: postcode

Telephone Number: \_\_\_\_\_

REGISTER AS HELPER    REGISTER AS ELDERLY

**Action:** Information entered for all items apart from Telephone Number and Register as Helper button is pressed.

#### E3.3.1

Second Line of Address: secondline

City: city

Country: country

Postal Code: postalcode

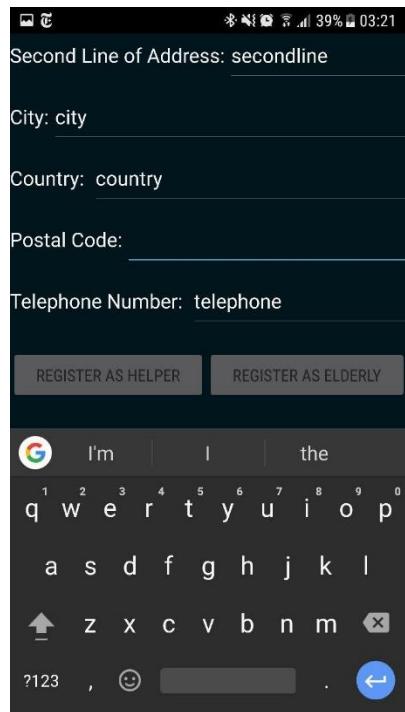

Telephone Number:

**Registration Unsuccessful**  
Not all required fields have been  
filled.

q w e r t y u i o p  
a s d f g h j k l  
z x c v b n m   
?123 , .

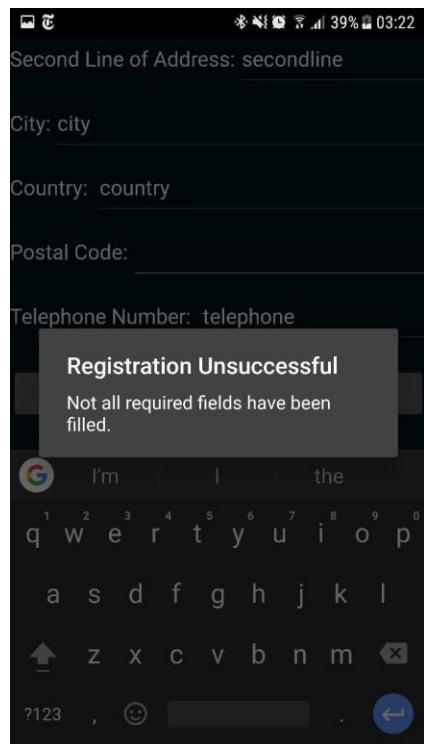

### T3.3.2

#### Starting State:

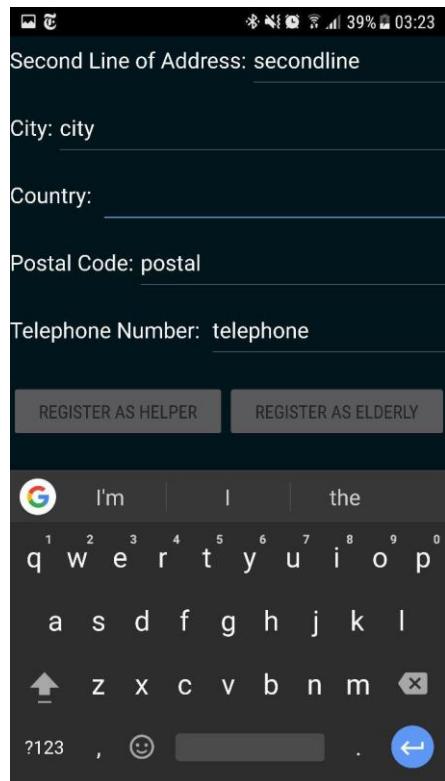

**Action:** All information is filled in apart from postal code and then the Register as Helper button is pressed.

### E3.3.2

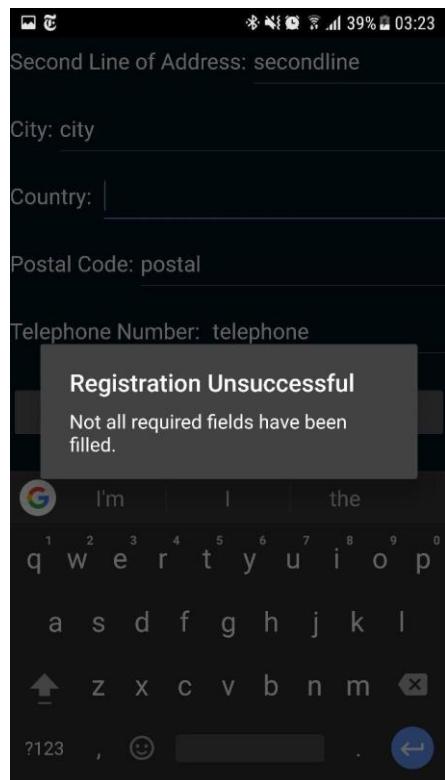

### T3.3.3

#### Starting State:

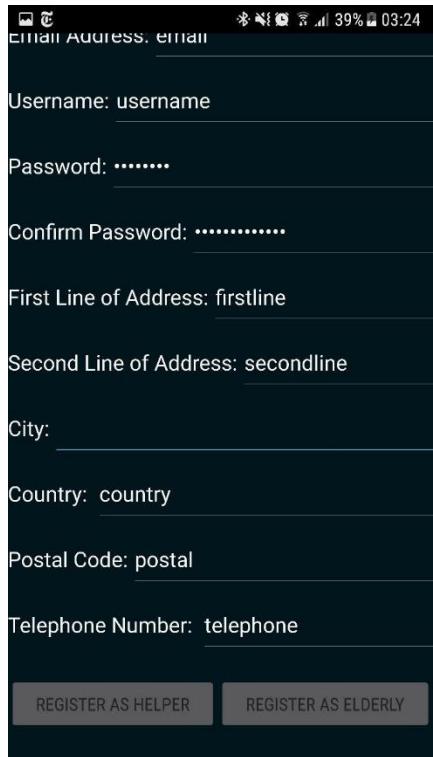

**Action:** All information is filled in apart from country and the Register as Helper button is pressed.

### E3.3.3

### T3.3.4

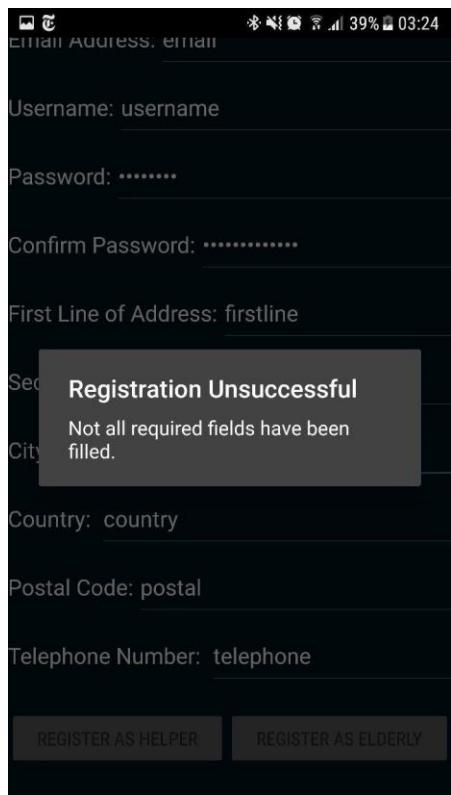

#### Starting State:

A screenshot of a mobile application registration form. At the top, there is a header bar with icons for signal strength, battery level (39%), and time (03:24). Below the header, the title "Initial Address, email" is displayed. The form consists of several text input fields: "Username: username", "Password: .....", "Confirm Password: .....", "First Line of Address: firstline", "Second Line of Address: secondline", "City: .....", "Country: country", "Postal Code: postal", and "Telephone Number: telephone". At the bottom of the form are two buttons: "REGISTER AS HELPER" and "REGISTER AS ELDERLY".

**Action:** All information is filled in apart from city and the Register as Helper button is pressed.

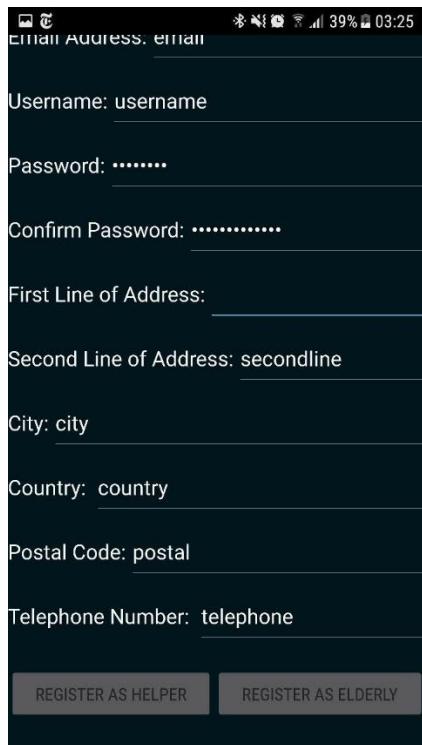

### E3.3.4

A screenshot of the same mobile application registration form as above, but with an error message displayed. A dark gray rectangular box covers the "City" field and part of the "Country" field. Inside the box, the text "Registration Unsuccessful" is at the top, followed by "Not all required fields have been filled." The rest of the form fields and buttons are visible below the error message.

### T3.3.5

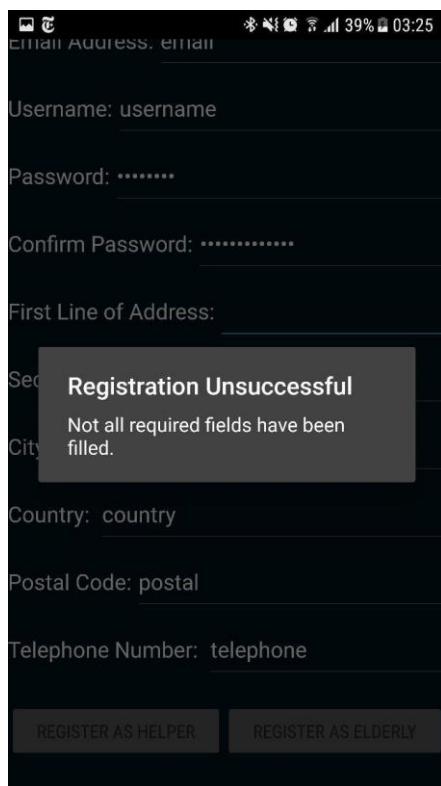

#### Starting State:

A screenshot of a mobile application registration form. At the top, there are icons for signal strength, battery level (39%), and time (03:25). Below these are fields for 'Email Address, email' (with placeholder 'email@example.com'), 'Username: username', 'Password: .....', 'Confirm Password: .....', 'First Line of Address: .....', 'Second Line of Address: secondline', 'City: city', 'Country: country', 'Postal Code: postal', and 'Telephone Number: telephone'. At the bottom are two buttons: 'REGISTER AS HELPER' and 'REGISTER AS ELDERLY'.

**Actions:** All information is filled in apart from first line of address and the register as helper button is pressed.

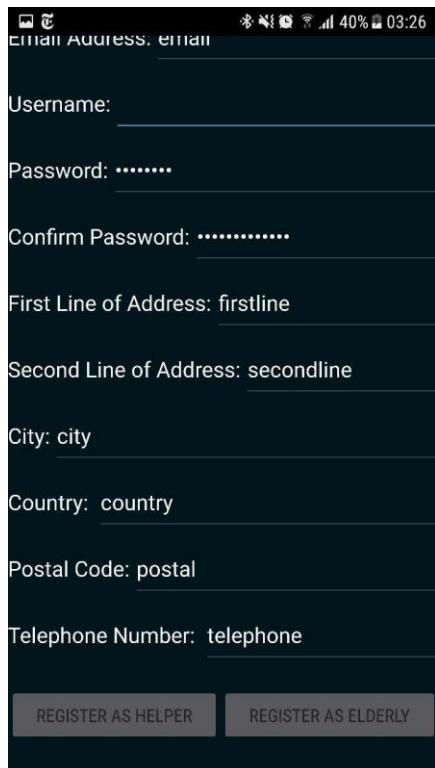

### E3.3.5

A screenshot of the same mobile application registration form as above, but with an error message displayed. A dark gray rectangular box covers the 'First Line of Address' field and part of the 'City' field. Inside the box, the text 'Registration Unsuccessful' is displayed in bold, followed by 'Not all required fields have been filled.' The rest of the form fields and buttons are visible below the message box.

### T3.3.6

#### Starting State:

A screenshot of a mobile application's registration form. At the top, there is a header bar with icons for signal strength, battery level (40%), and time (03:26). Below the header, the title "Email Address, email" is displayed. The form consists of several text input fields and two button options at the bottom.

Fields and their values:

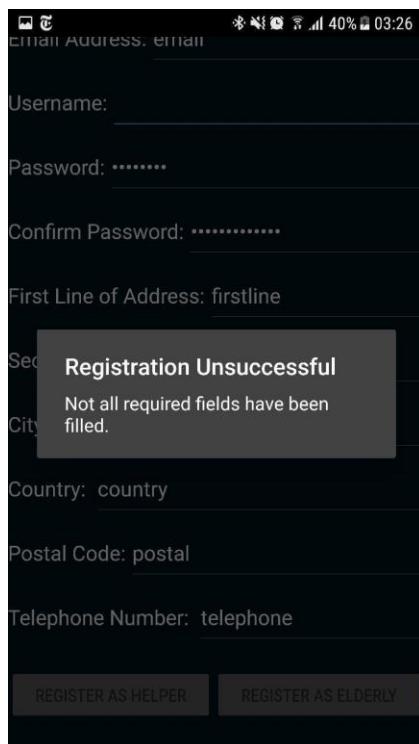

- Username: \_\_\_\_\_
- Password: .....
- Confirm Password: .....
- First Line of Address: firstline
- Second Line of Address: secondline
- City: city
- Country: country
- Postal Code: postal
- Telephone Number: telephone

Buttons at the bottom:

- REGISTER AS HELPER
- REGISTER AS ELDERLY

**Actions:** All the information is filled in apart from the username field and the register as helper (and register as elderly) button is pressed.

### E3.3.6

A screenshot of the same mobile application's registration form, but with an error message displayed. A dark gray rectangular box covers the middle section of the form, containing the text "Registration Unsuccessful" and "Not all required fields have been filled." The rest of the form fields and buttons are visible below the message box.

Fields and their values (from top to bottom):

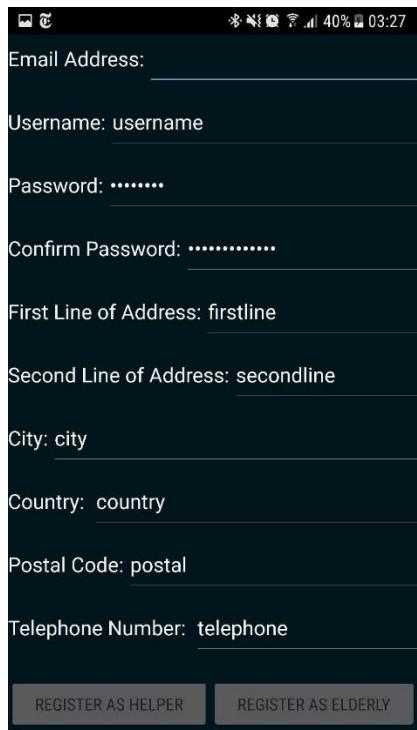

- Username: \_\_\_\_\_
- Password: .....
- Confirm Password: .....
- First Line of Address: firstline
- Second Line of Address: \_\_\_\_\_
- City: \_\_\_\_\_
- Country: country
- Postal Code: postal
- Telephone Number: telephone

Buttons at the bottom:

- REGISTER AS HELPER
- REGISTER AS ELDERLY

### T3.3.7

#### Starting State:

A screenshot of a mobile application registration form. The screen shows various input fields for user information. At the bottom are two buttons: "REGISTER AS HELPER" and "REGISTER AS ELDERLY".

Email Address: \_\_\_\_\_

Username: username

Password: .....

Confirm Password: .....

First Line of Address: firstline

Second Line of Address: secondline

City: city

Country: country

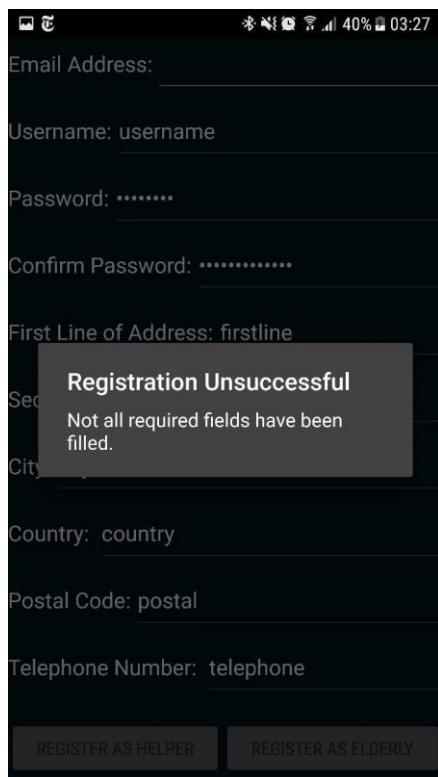

Postal Code: postal

Telephone Number: telephone

**REGISTER AS HELPER**   **REGISTER AS ELDERLY**

**Actions:** All the information is filled in apart from the email address and the register as helper and register as elderly button is pressed.

### E3.3.7

A screenshot of the same mobile application registration form, but with an error message displayed. A dark gray callout box with rounded corners is centered over the input fields for "First Line of Address" and "Second Line of Address". The text inside the box reads: "Registration Unsuccessful" followed by "Not all required fields have been filled." The rest of the form fields and buttons are visible below the message.

Email Address: \_\_\_\_\_

Username: username

Password: .....

Confirm Password: .....

First Line of Address: firstline

Registration Unsuccessful  
Not all required fields have been filled.

Second Line of Address: secondline

City: \_\_\_\_\_

Country: country

Postal Code: postal

Telephone Number: telephone

**REGISTER AS HELPER**   **REGISTER AS ELDERLY**

### T3.3.8

#### Starting State:

First Name: firstname

Surname: surname

Email Address: email

Username: username

Password: .....

Confirm Password: .....

First Line of Address: firstline

Second Line of Address: secondline

City: city

Country: country

Postal Code: postal

**Actions:** All information is filled in except the password is entered differently in the password and confirm password fields.

### E3.3.8

Email Address: email \* 40% 03:28

Username: username

Password: \*\*\*\*\*

Confirm Password: \*\*\*\*\*

First Line of Address: firstline

Second Line of Address: secondline

City: city

Country: country

Postal Code: postal

Telephone Number: telephone

**Registration Unsuccessful**  
Not all required fields have been filled.

REGISTER AS HELPER REGISTER AS ELDERLY

### T3.3.9

#### Starting State:

First Name: \_\_\_\_\_

Surname: surname

Email Address: email

Username: username

Password: \*\*\*\*\*

Confirm Password: \*\*\*\*\*

First Line of Address: firstline

Second Line of Address: secondline

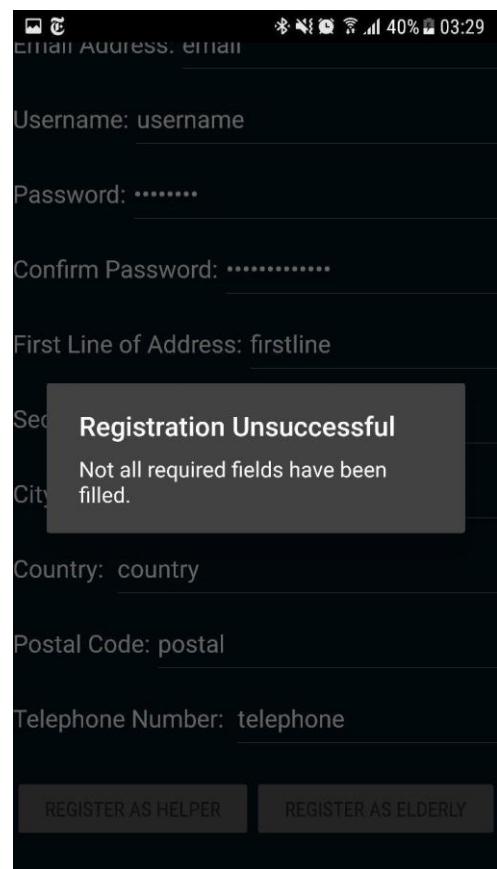

City: city

Country: country

Postal Code: postal

**Actions:** All information is entered except the first name. Then, the register as helper and register as elderly button is pressed.

### E3.3.9

### T3.3.11

**Start State:**

Email Address: email

Username: username

Password: .....

Confirm Password: .....

First Line of Address: firstline

Second Line of Address: secondline

City: city

Country: country

Postal Code: postal

Telephone Number: telephone

[REGISTER AS HELPER](#)

[REGISTER AS ELDERLY](#)

**Actions:** All information is entered correctly, apart from the password and confirm password fields having a different value. Then, the register as helper button (and register as elderly button in the second part of the test) is pressed.

### E3.3.11

Screenshot of a mobile application showing a registration form. The form includes fields for Email Address, Username, Password, Confirm Password, First Line of Address, Second Line of Address (which contains the error message), City, Country, Postal Code, and Telephone Number. At the bottom are two buttons: 'REGISTER AS HELPER' and 'REGISTER AS ELDERLY'. A dark gray overlay box covers the middle section of the form, displaying the error message: 'Registration Unsuccessful' followed by 'Not all required fields have been filled.'

Email Address: email

Username: username

Password: .....

Confirm Password: .....

First Line of Address: firstline

Second Line of Address: **Registration Unsuccessful**  
Not all required fields have been filled.

City:

Country: country

Postal Code: postal

Telephone Number: telephone

REGISTER AS HELPER   REGISTER AS ELDERLY

### T3.3.12

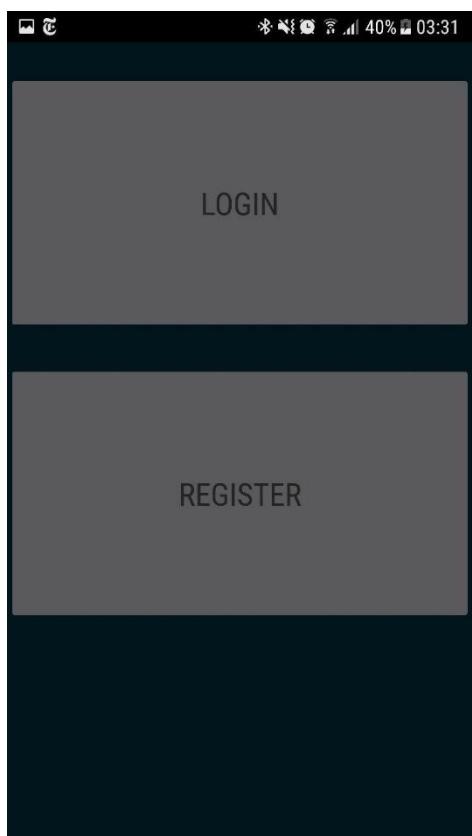

**Start State:**

A screenshot of a mobile application showing a registration form. The form consists of several text input fields:

- First Name: `firstname`
- Surname: `surname`
- Email Address: `email`
- Username: `username`
- Password: `.....`
- Confirm Password: `.....`
- First Line of Address: `firstline` (with the cursor active)
- Second Line of Address: `secondline`
- City: `city`
- Country: `country`
- Postal Code: `postal`

**Actions:** The back button (on the phone) is pressed.

### E3.3.12

### 3.4

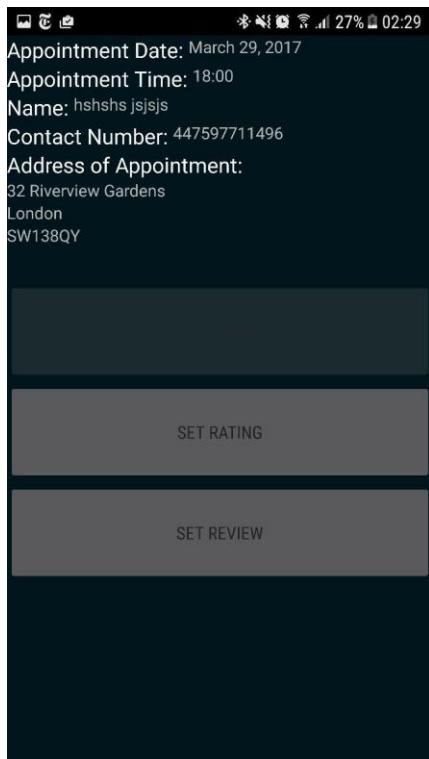

#### T3.4.1

**Start State:** List of appointments screen.

**Actions:** One of the appointments is pressed and it is checked that the appointments details screen is opened.

### E3.4.1

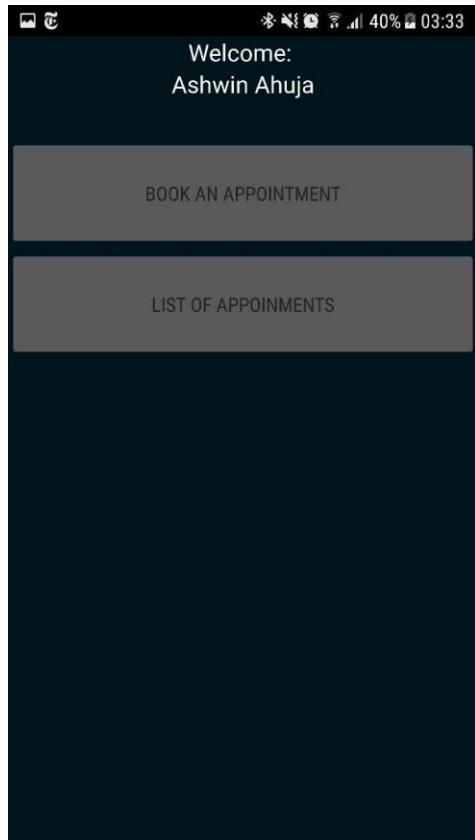

### T3.4.2

**Starting State:** List of appointments screen.

**Actions:** Back button (on the phone) is pressed.

### E3.4.2

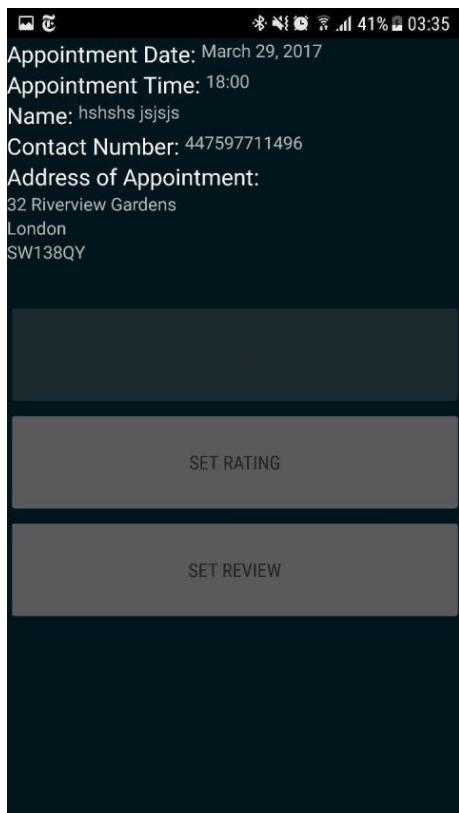

### 3.5

#### T3.5.1

**Start State:** Appointment Details screen.

**Actions:** The back button is pressed on the phone.

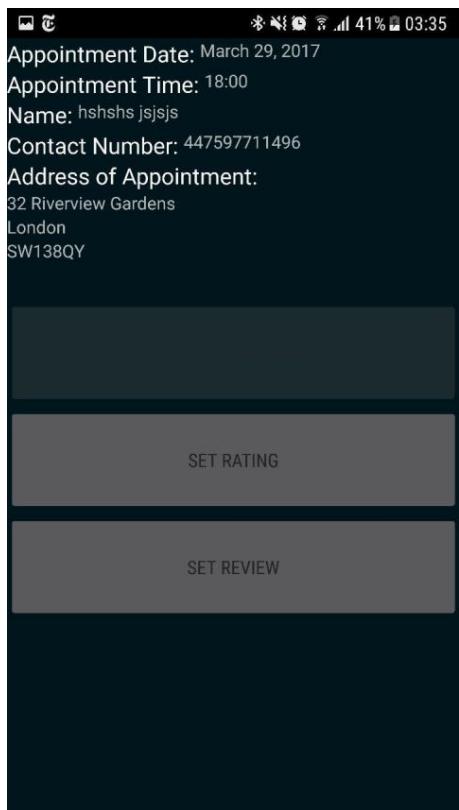

### E3.5.1

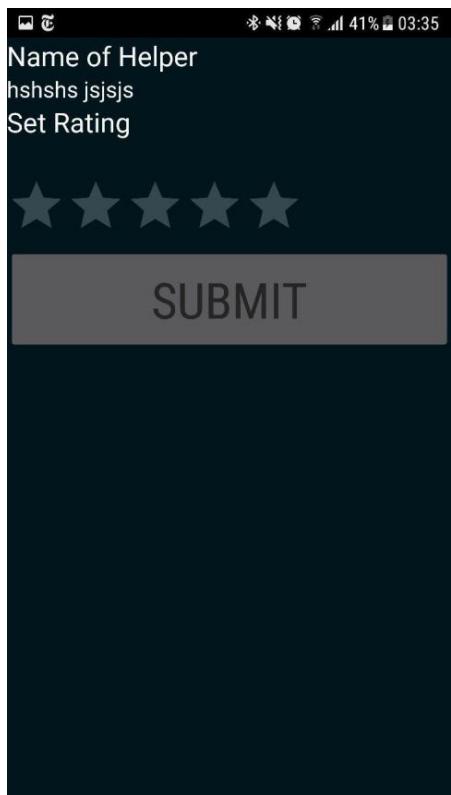

### T3.5.2

**Start State:** Appointment Details Screen.

**Actions:** Click the Set Ratings Button (and check that the ratings screen is opened).

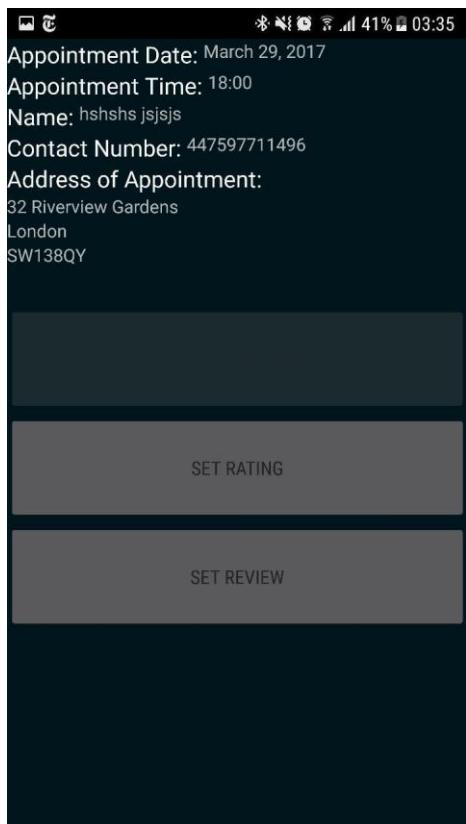

### E3.5.2

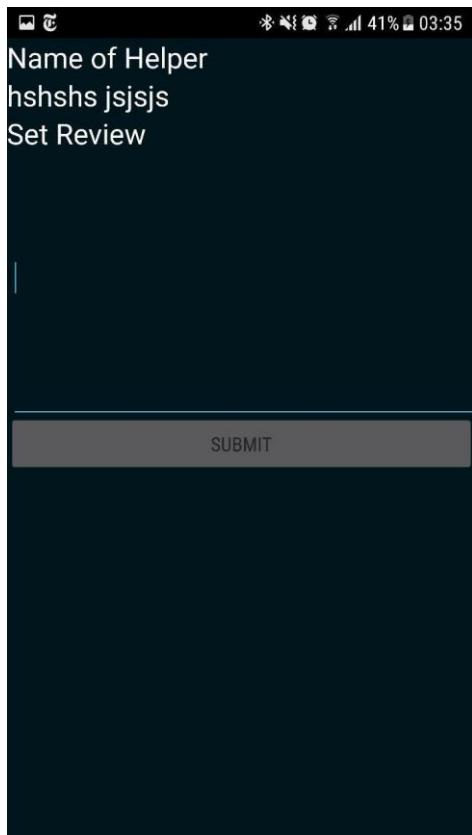

### T3.5.3

**Start State:** Appointment Details Screen.

**Actions:** Set Review button is pressed, and it is checked whether the ratings screen is opened.

### E3.5.3

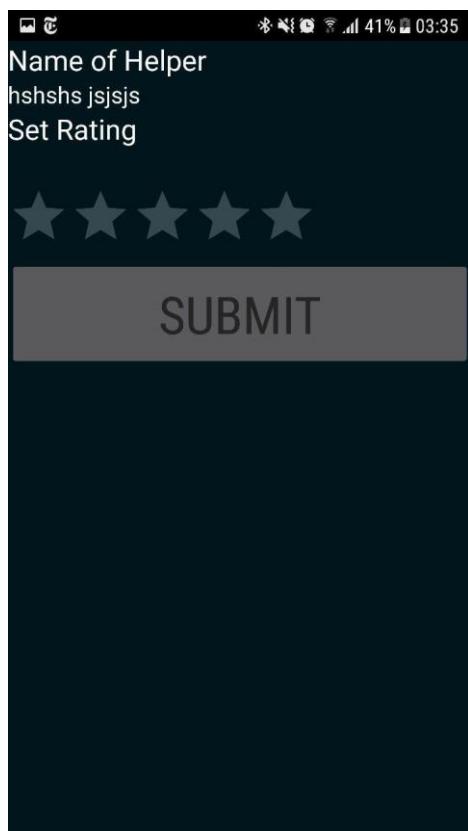

### 3.6

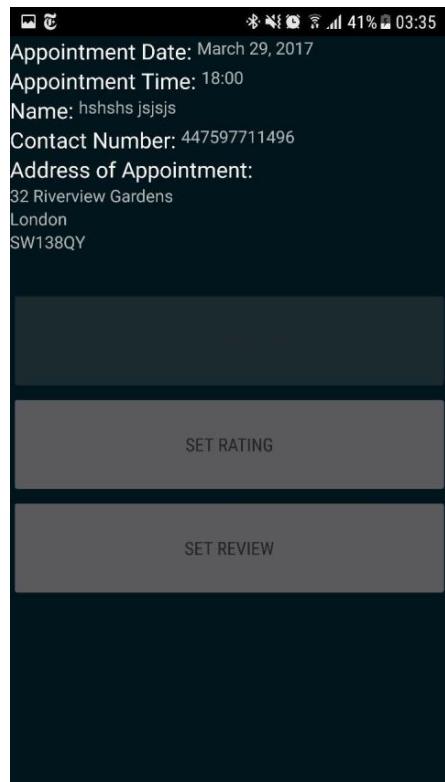

#### T3.6.1

**Start State:** Ratings screen.

**Actions:** The back button is pressed and it is checked that you go back to the details about the appointment.

### E3.6.1

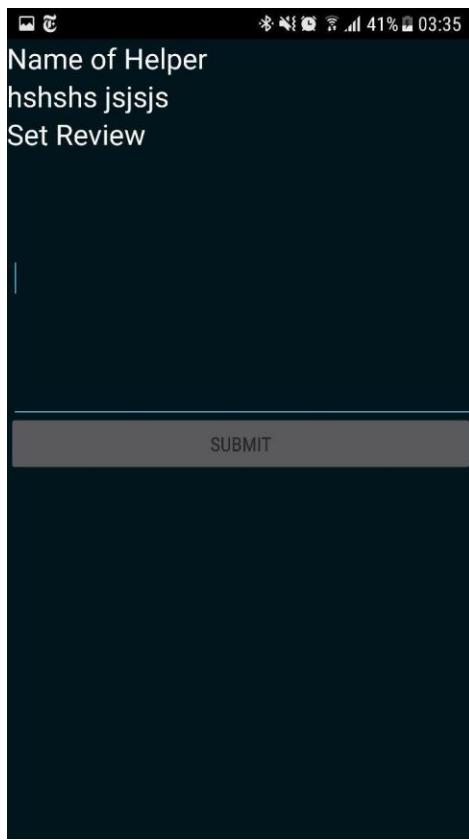

### 3.7

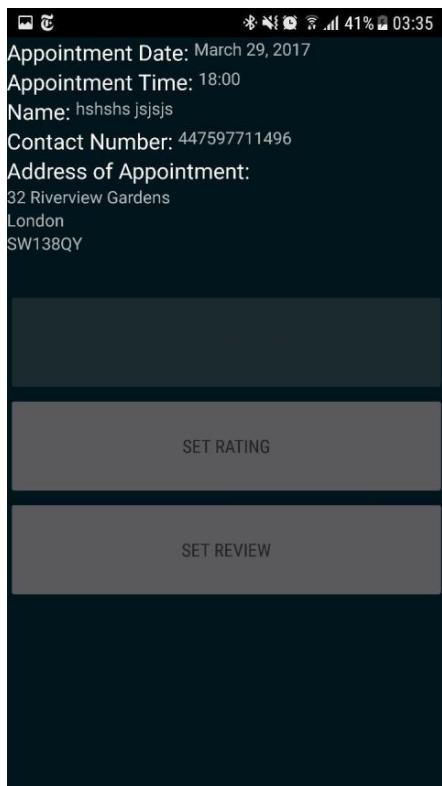

#### T3.7.1

**Start State:** Set review screen.

**Actions:** Press back button.

### E3.7.1

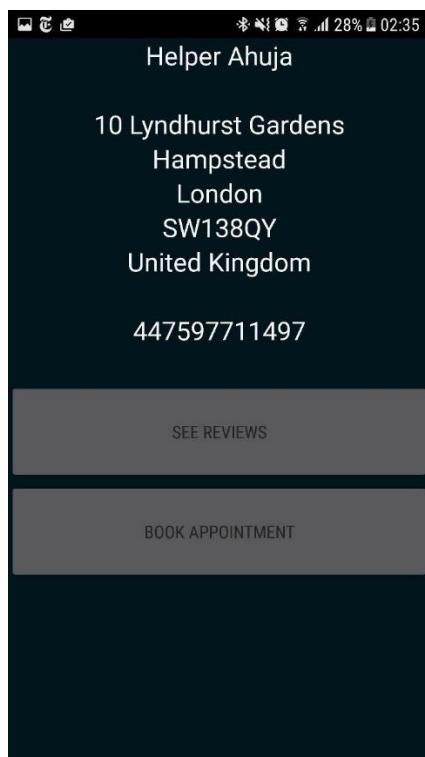

## 3.8

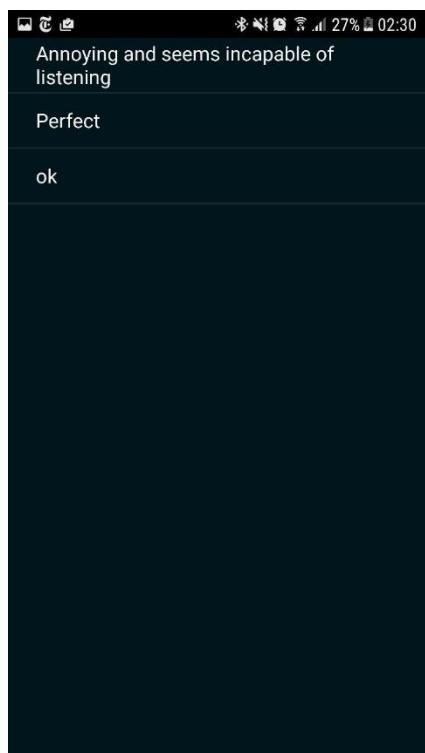

### T3.8.1

**Start State:** The helper details screen.

**Actions:** Click the 'See Reviews' button and check that the list of reviews screen appears.

### E3.8.1

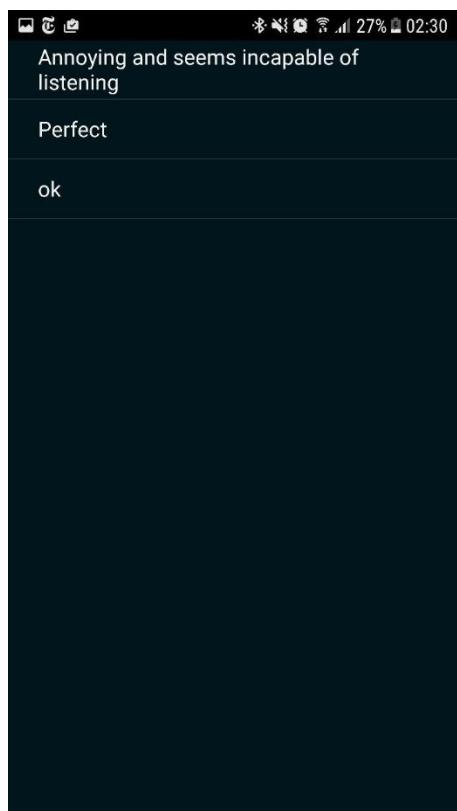

### 3.9

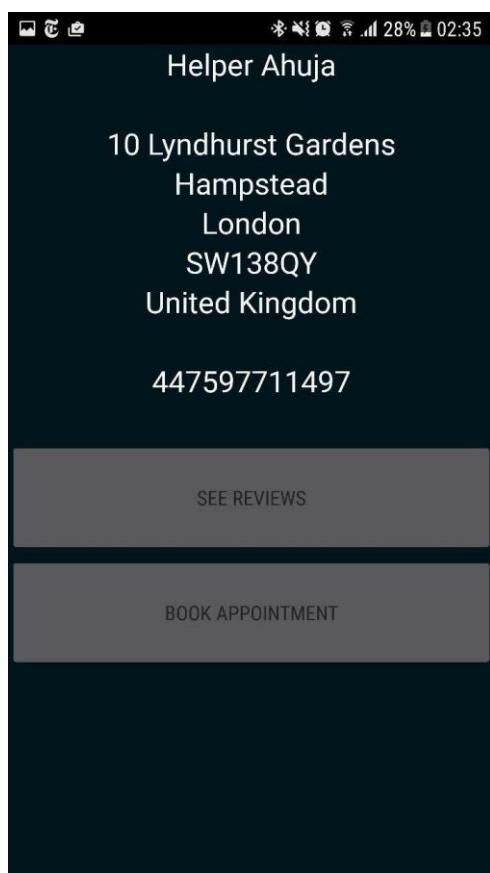

#### T3.9.1

**Start State:** See reviews screen.

**Actions:** The back button is pressed and it is checked that you get to the helper details screen.

E3.9.1

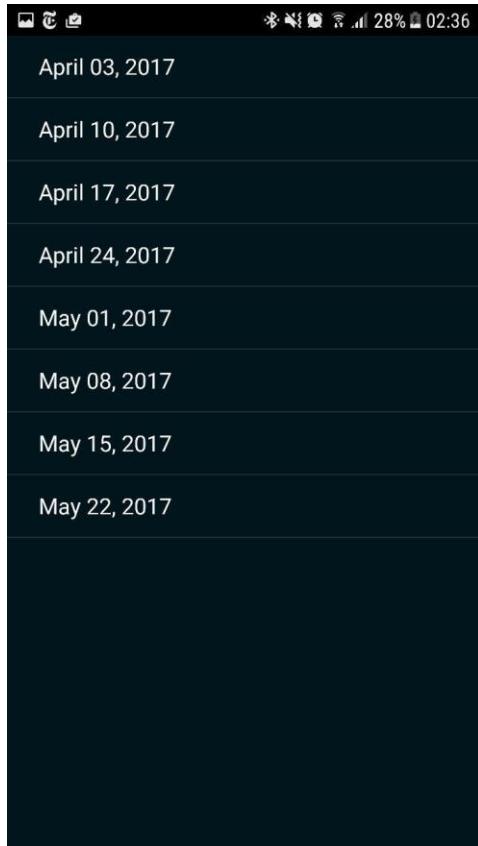

### *3.10*

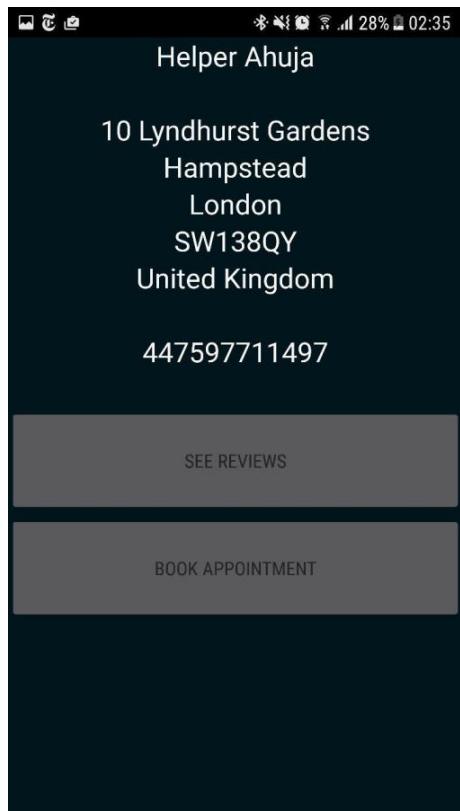

#### T3.10.1

**Start State:** The weeks screen of the book appointment screen.

**Actions:** Press back button.

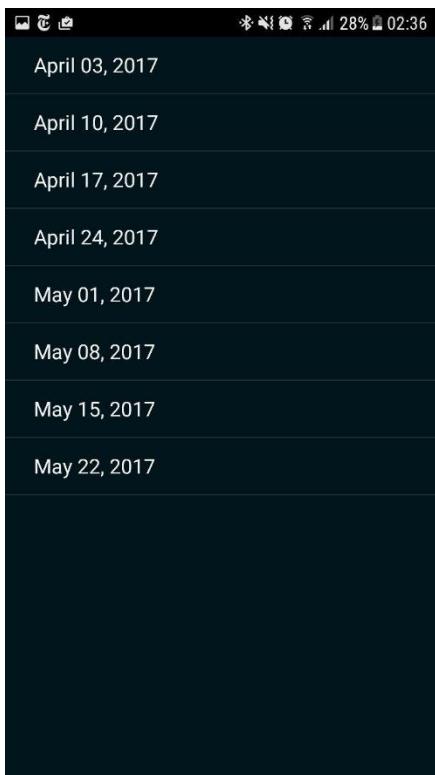

### E3.10.1

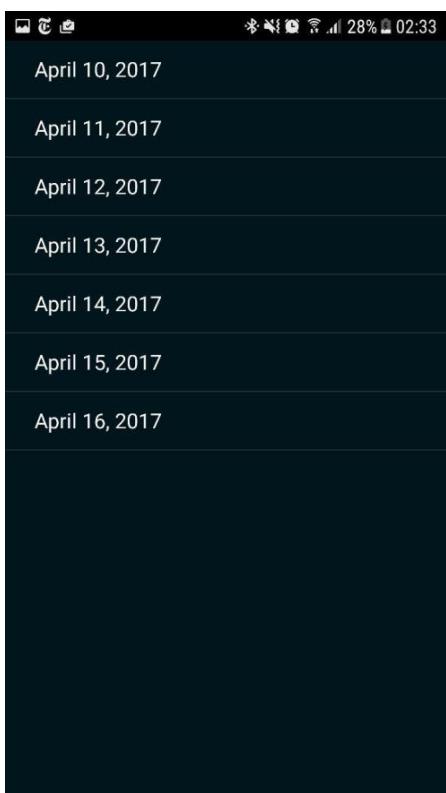

### T3.10.2

**Start State:** The weeks screen of the book appointment screen.

**Actions:** Click on one of the weeks – in this case ‘April 10<sup>th</sup>, 2017’ and check the days screen of this week appears.

### E3.10.2

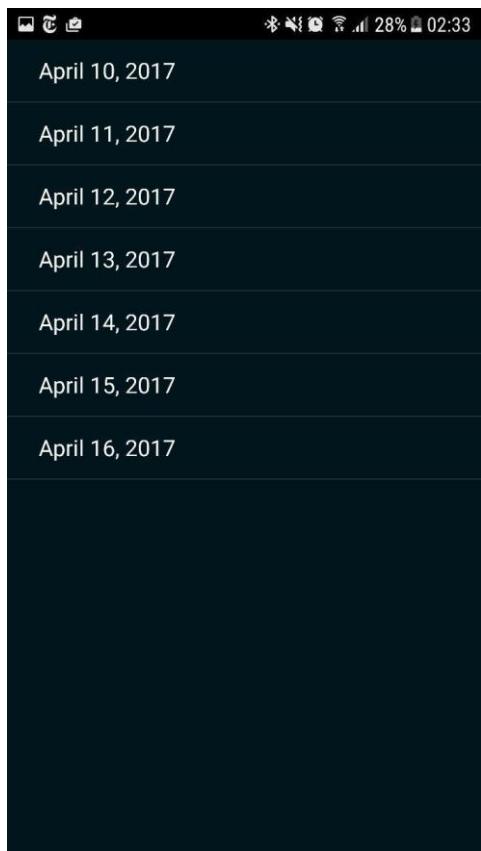

### 3.11

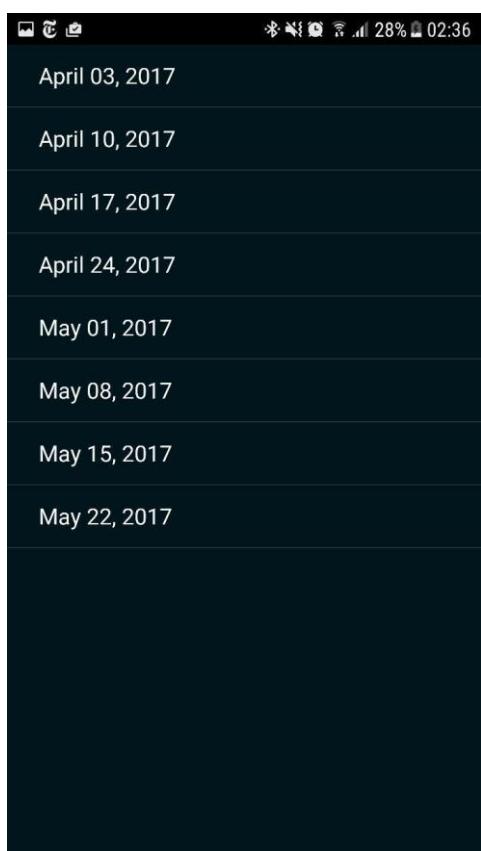

#### T3.11.1

**Start State:** The days screen of booking an appointment.

**Actions:** Press back button of the phone and check that the weeks screen is opened.

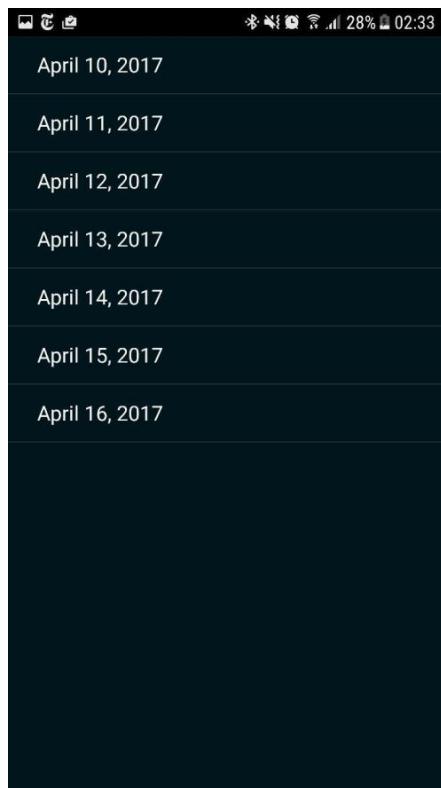

### E3.11.1

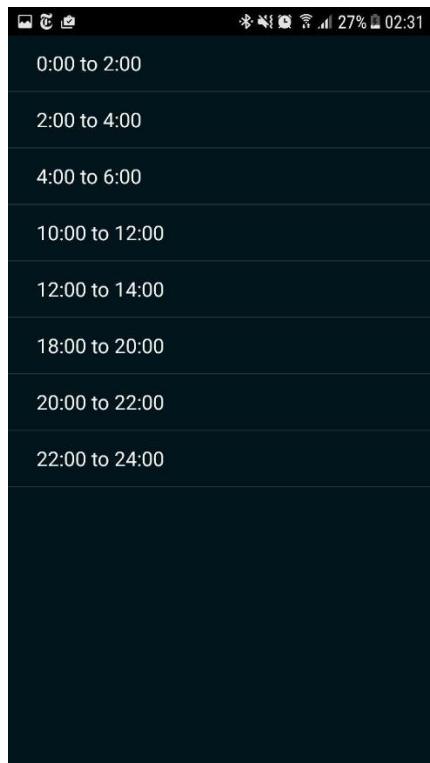

### T3.11.2

**Start State:** The days screen of booking an appointment.

**Actions:** Click on one of the days and check that the times screen for that day appears.

### E3.11.2

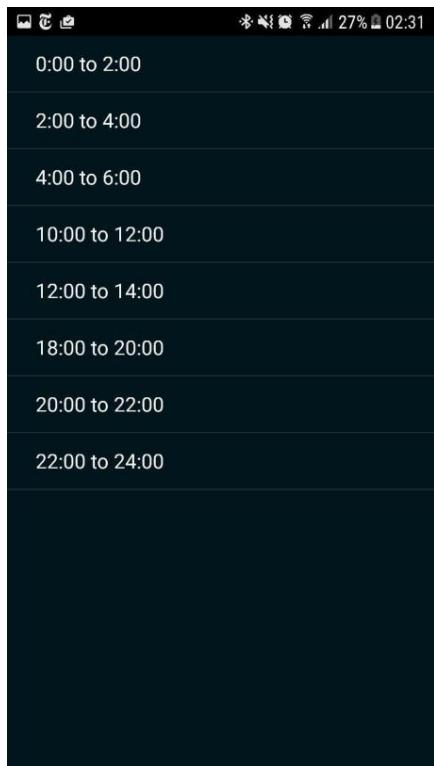

### 3.12

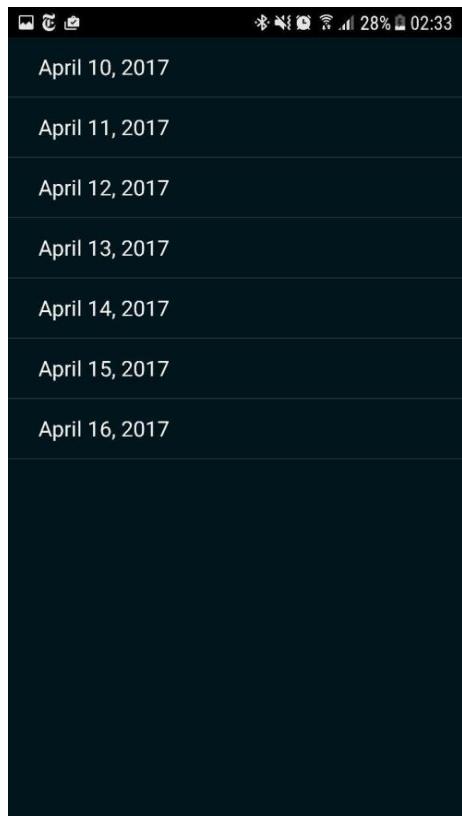

#### T3.12.1

**Start State:** The times screen for the booking of an appointment.

**Actions:** Click the back button on the phone and check that the days screen is reopened.

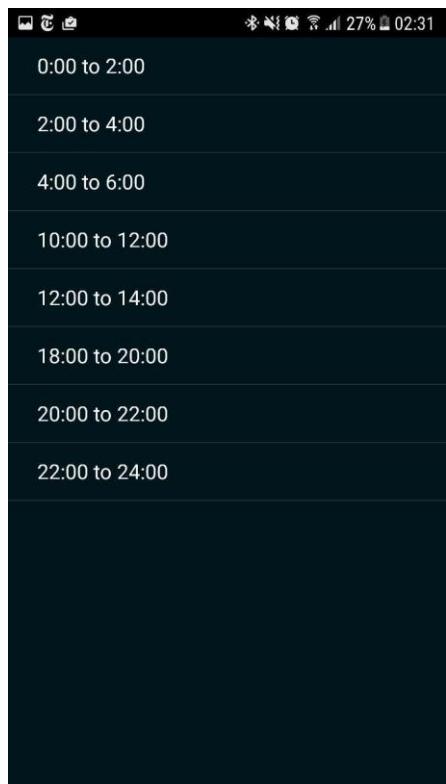

### E3.12.1

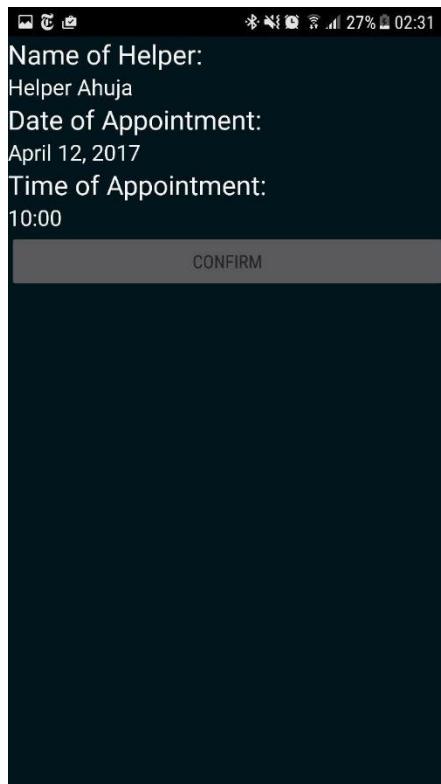

### T3.12.2

**Start State:** Times screen of booking an appointment.

**Actions:** Click on one of the times and check that the correct confirm appointment screen appears.

### E3.12.2

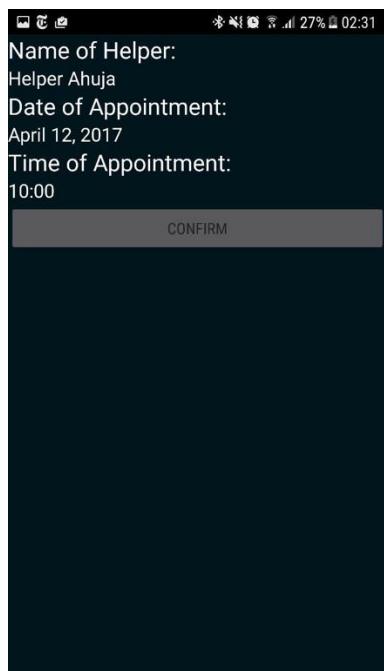

### 3.13

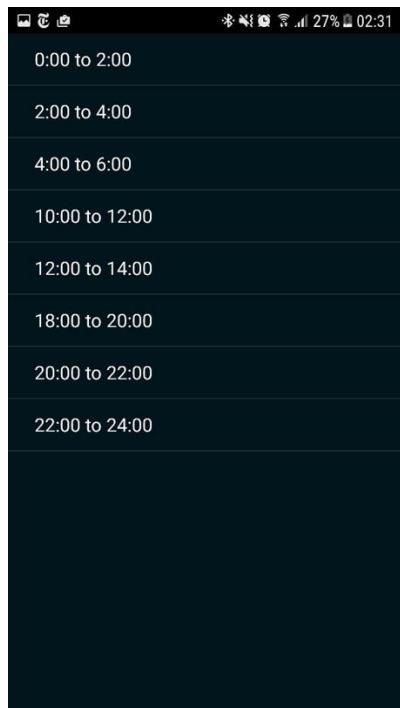

#### T3.13.1

**Start State:** Helper details screen.

**Actions:** Press the back button and check the times screen appears.

### E3.13.1

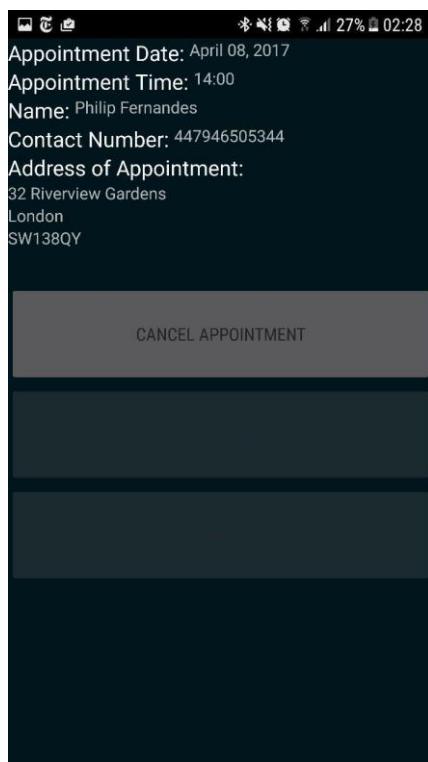

### 3.14

#### T3.14.1

**Start State:** Appointment Details screen.

**Actions:** Press back button and check that you get back to the list of appointments.

### E3.14.1

**Actions:** Click the list of appointments button and check the list of appointments screen appears.

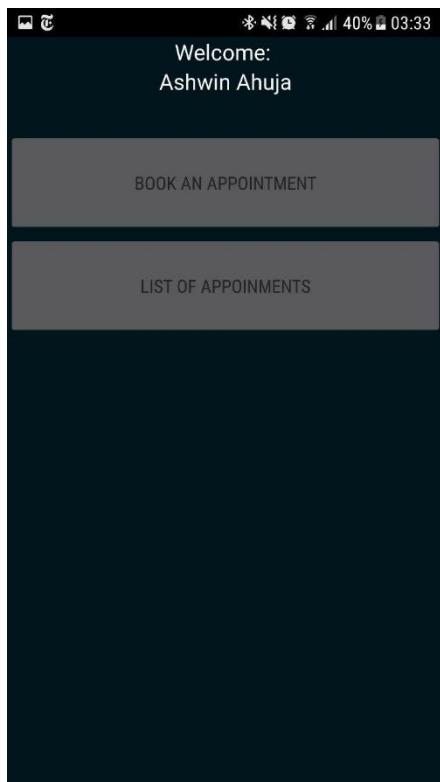

### E3.18.1

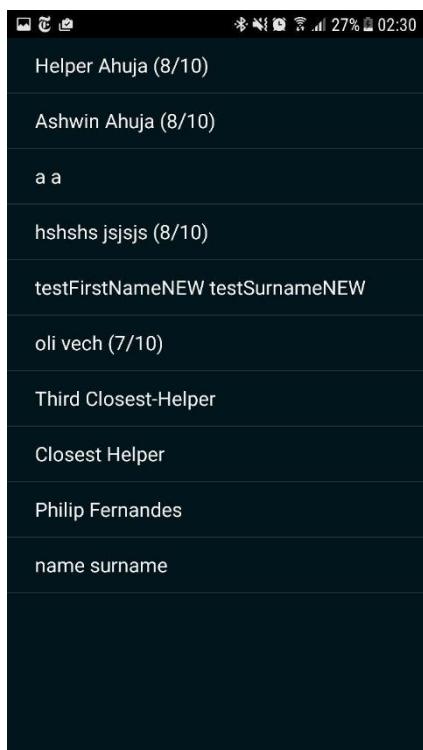

### T3.18.2

**Start State:** Welcome elderly screen.

**Actions:** Click the book an appointment screen and check the list of helpers nearby screen appears.

### E3.18.2

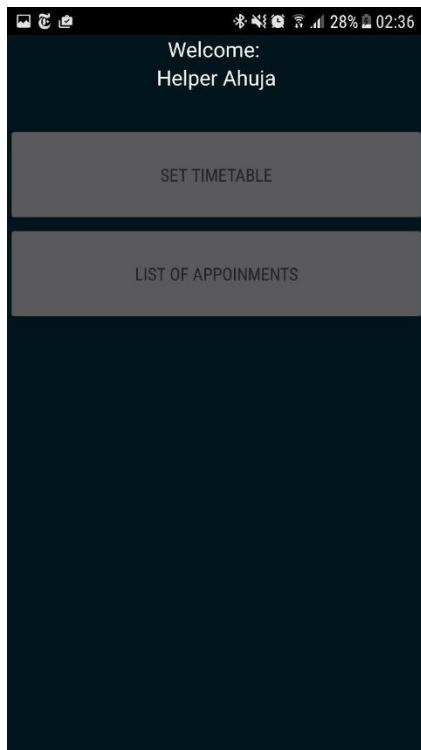

### 3.19

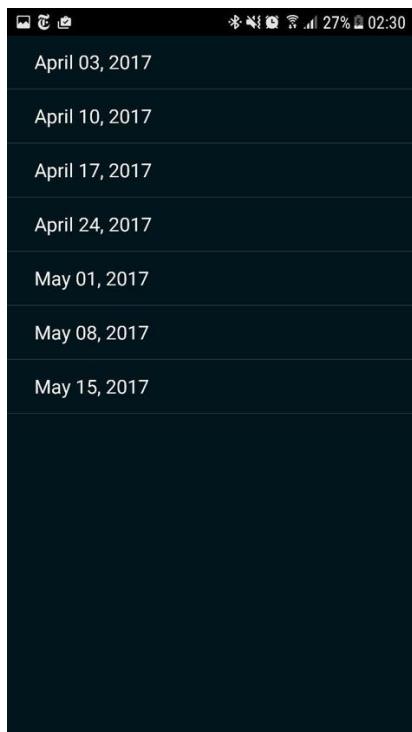

#### T3.19.1

**Start State:** Welcome helper screen.

**Actions:** Click the set timetable button and check the weeks screen of the set timetable system appears.

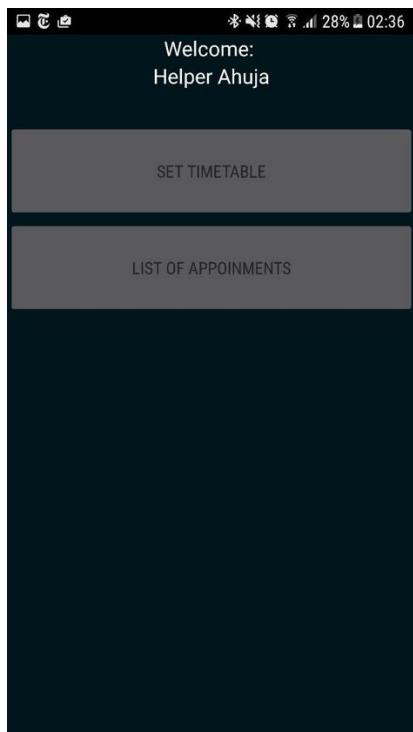

#### E3.19.1

### T3.19.2

**Start State:** Welcome helpers screen.

**Actions:** Click the list of appointments button and check if the list of appointments screen appears.

### E3.19.2

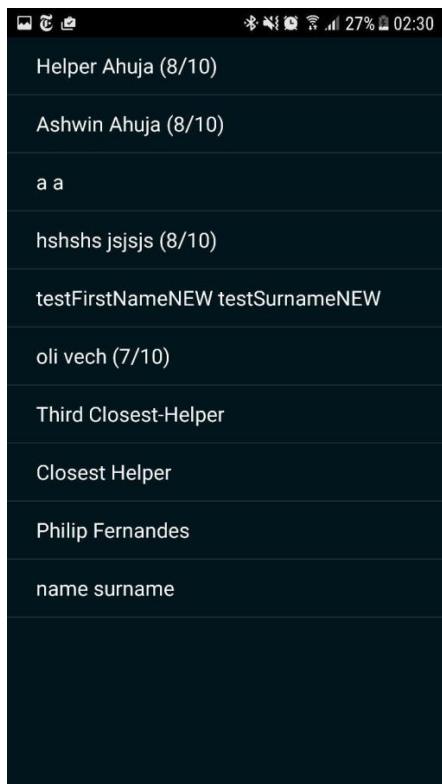

## 3.20

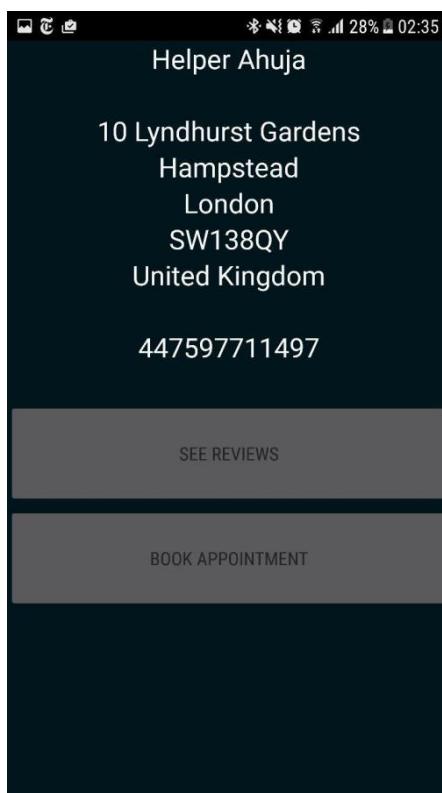

### T3.20.1

**Start State:** ListOfNearbyHelpers screen.

**Actions:** Click on one of the helpers and check the helperDetails screen appears.

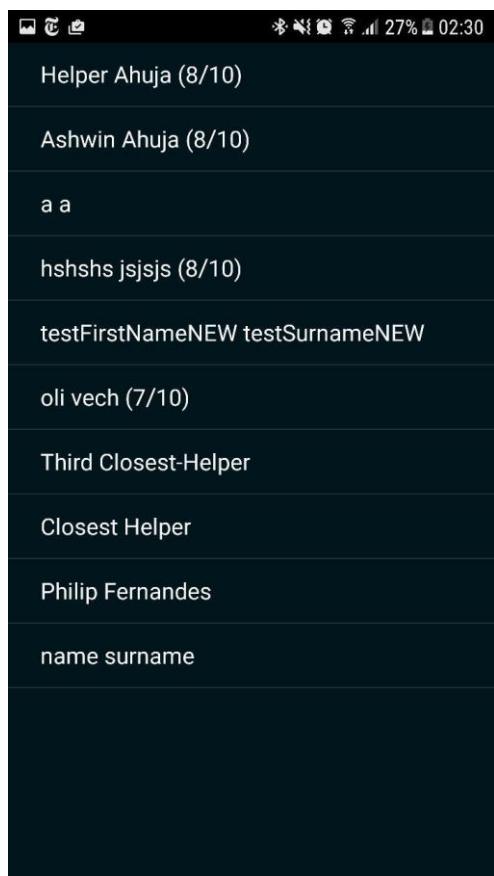

E3.20.1

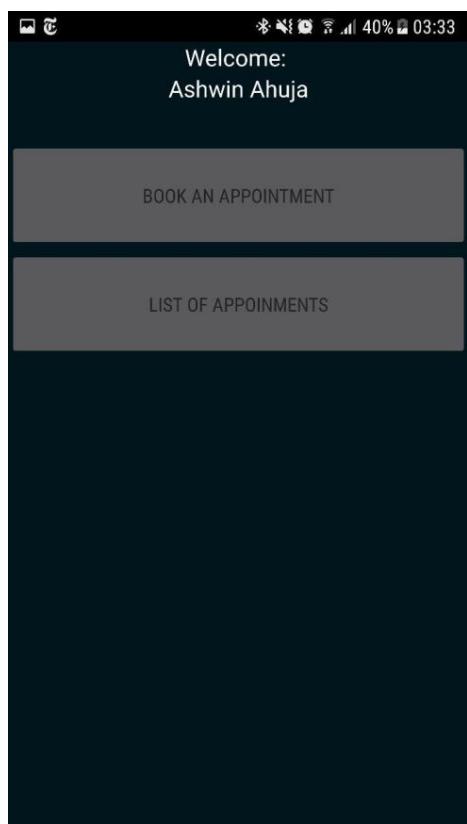

T3.20.2

**Start State:** ListOfNearbyHelpers screen.

**Actions:** Press the back button and check that the welcomeHelper screen appears.

E3.20.2

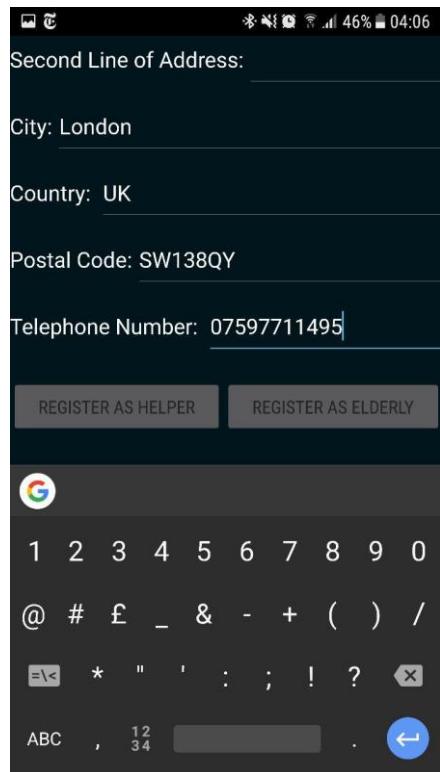

## Test Series 4

### 4.1

#### T4.1.1

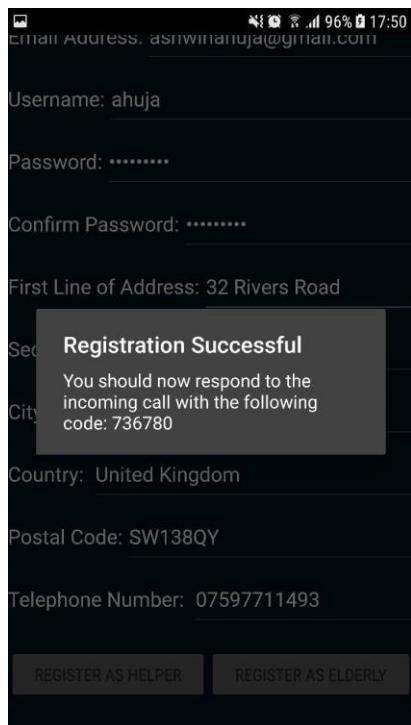

**Start State:** Register screen.

**Actions:** Fill in all information correctly and press the register as elderly button.

#### E4.1.1

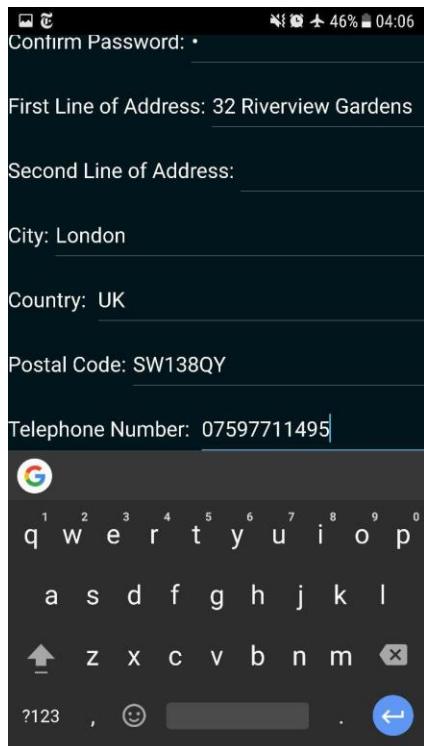

**Expected Result:** Check the registration is successful and check that the phone number can then be verified, by responding using this code in the phone call received from Twilio.

#### T4.1.2

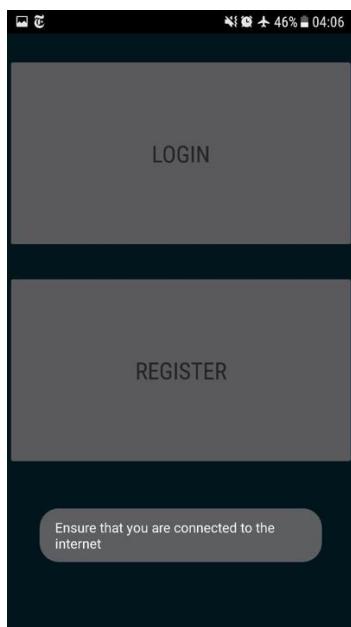

**Start State:** Register screen.

**Actions:** With not connected internet (turn on Airplane mode) attempt to press the register as helper button.

#### E4.1.2

**Expected Result:** Check there is a notification saying that there is no internet connection and that the loginOrRegister screen is opened.

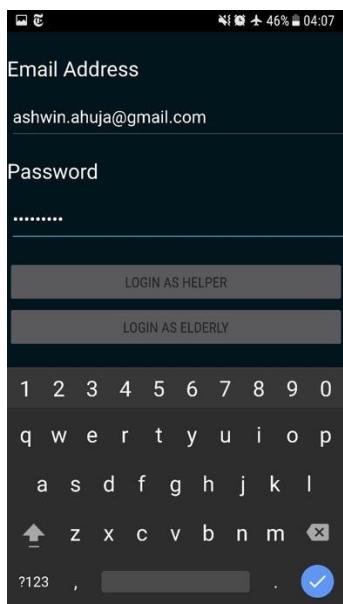

#### 4.2

##### T4.2.1

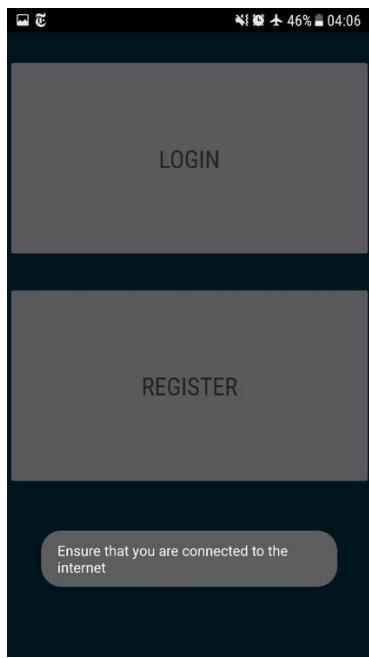

**Start State:** Login screen

**Actions:** Correctly fill in all the information and click the login button (both in turn) with no internet connection.

#### E4.2.1

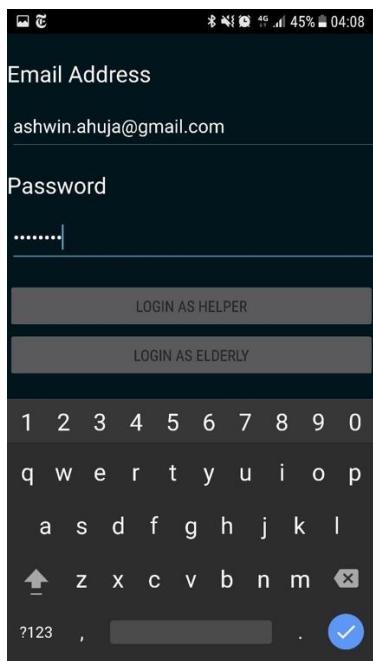

**Expected Result:** Check there is a notification saying that there is no internet connection and that the loginOrRegister screen is opened.

#### T4.2.2

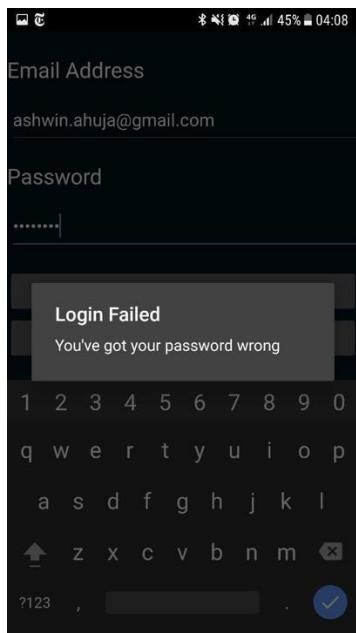

**Start State:** Login screen.

**Actions:** Fill in the email address and password of an incorrect user account and press the login as helper (and the login as elderly button, for another test)

#### E4.2.2

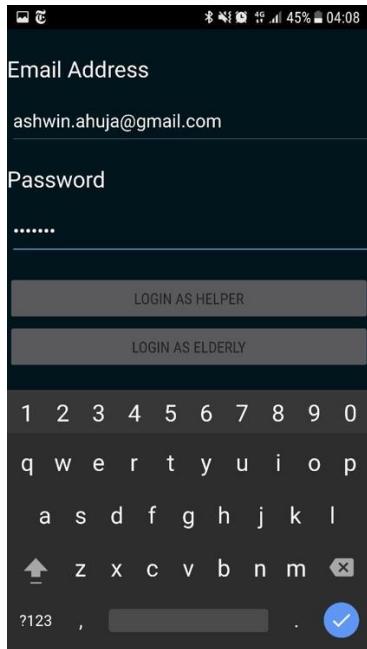

**Expected Result:** There is a popup dialog telling you that the login failed and you are not allowed into the rest of the application.

#### T4.2.3

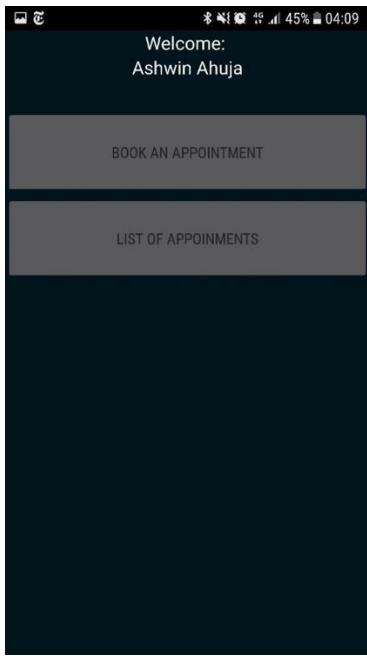

**Start State:** Login screen.

**Actions:** Enter correct details and press the respective login button (for an elderly and helper account).

#### E4.2.3

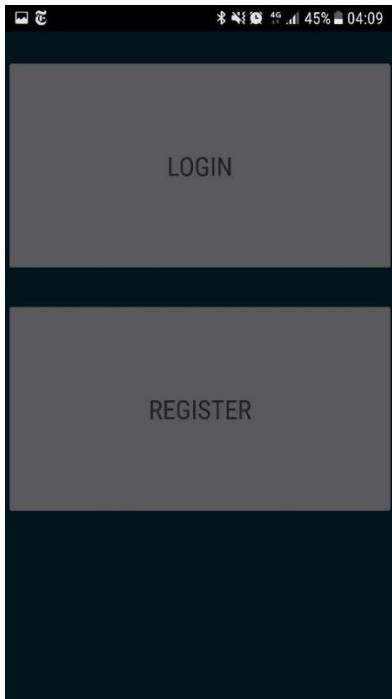

**Expected Result:** You should get taken to the respective welcome screen, helper if logged in as a helper or elderly if logged in as an elderly person.

#### T4.2.4

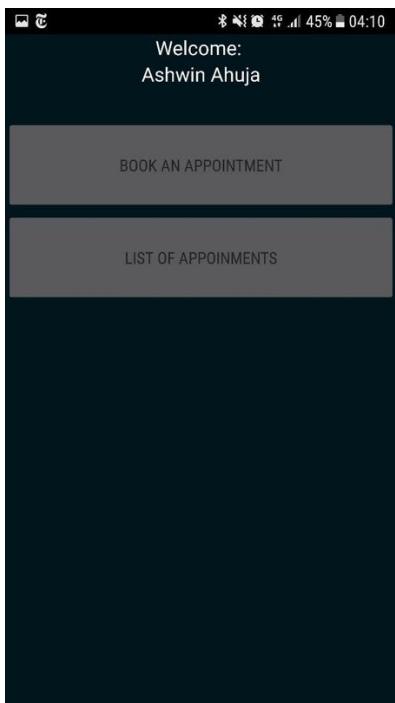

**Start State:** Start screen (after having previously logged in successfully).

**Actions:** Press the login button.

#### E4.2.4

**Expected Result:** Be taken to the correct welcome screen (helper or elderly), depending on which user account had been previously logged into.

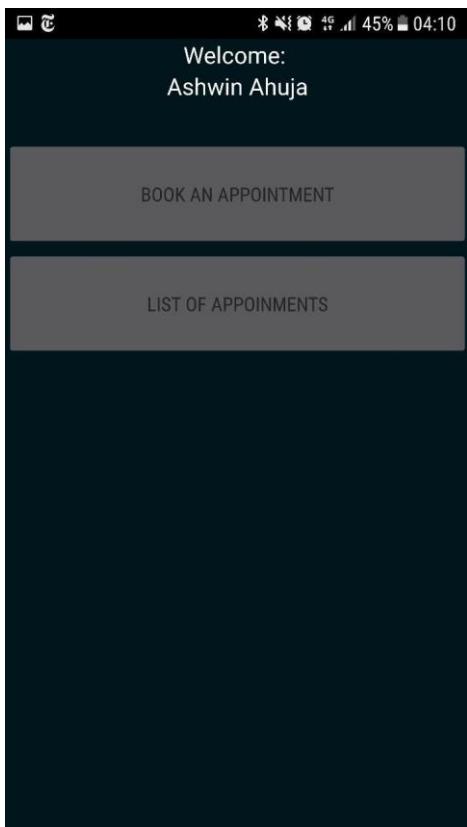

#### 4.4

##### T4.4.1

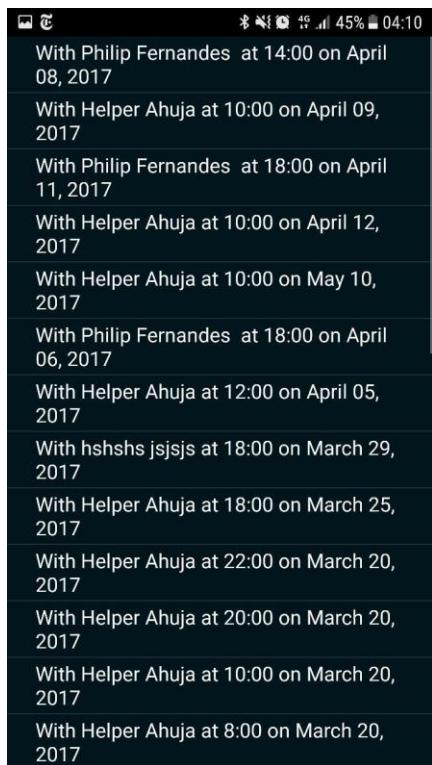

**Start State:** Welcome screen for the elderly.

**Actions:** Click the 'List of Appointments' button.

#### E4.4.1

**Expected Result:** The list of appointments should be displayed in the below format. They should be ordered as upcoming appointments first, before going back into the past. The list of appointments can be verified by ensuring the appointments listed in test 1.7.11 are displayed.

#### 4.5

##### T4.5.1

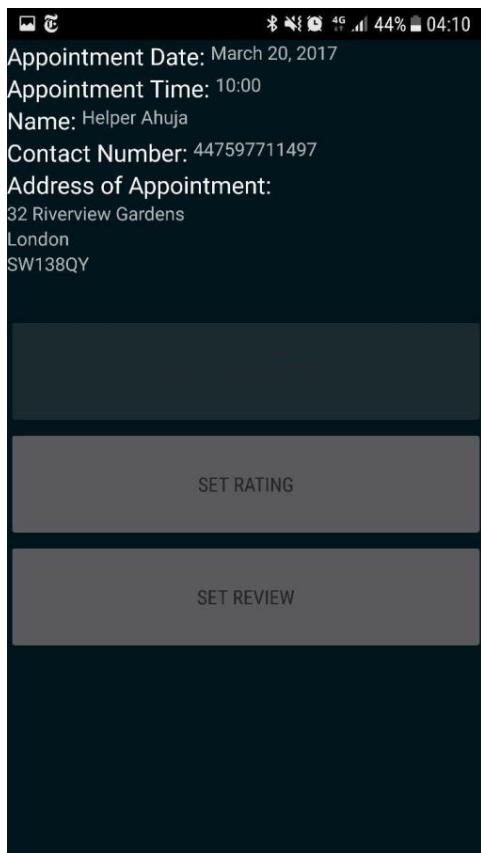

**Start State:** List of appointment screen.

**Actions:** Click any appointment.

#### E4.5.1

**Expected Result:** The appointment details screen will be displayed according to information from test 1.7.7.

#### T4.5.2

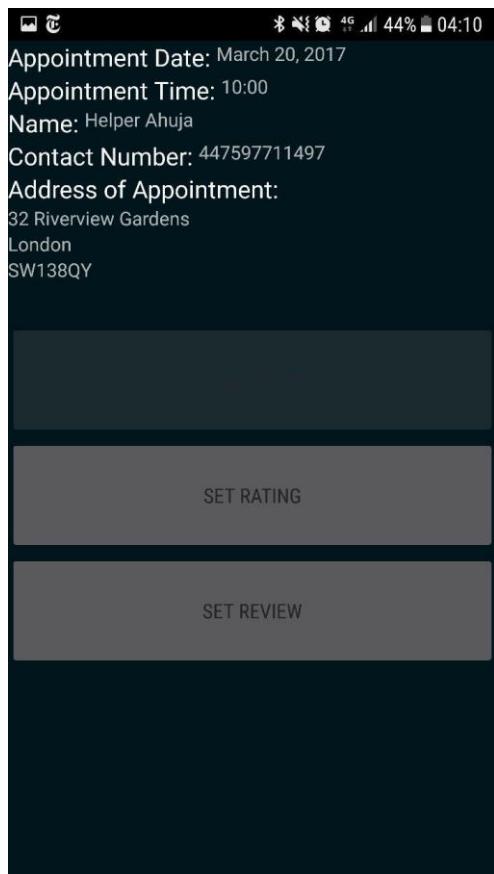

**Start State:** List of appointments screen.

**Actions:** Click an appointment in the past.

#### E4.5.2

**Expected Result:** The Set Rating and Set Review button should be visible, while the cancel appointment button should not be.

#### T4.5.3

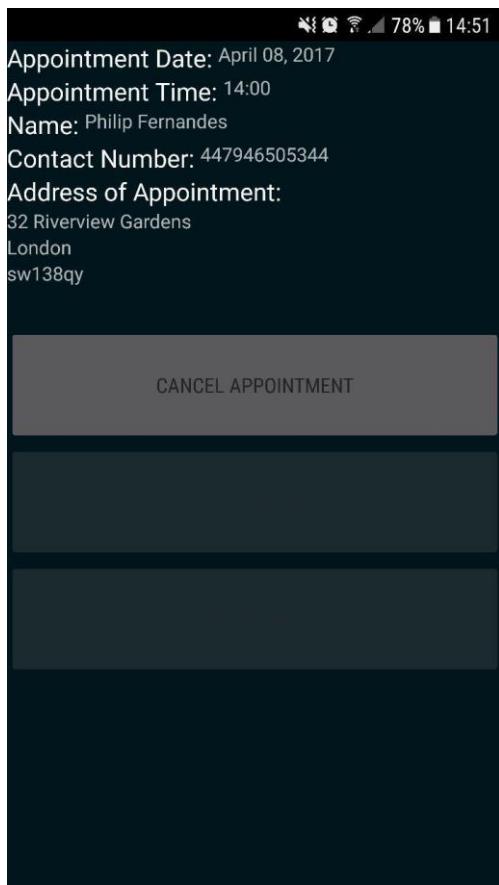

**Start State:** The List of Appointments screen.

**Actions:** Click an appointment in the future.

#### E4.5.3

**Expected Result:** The Cancel button should be visible while the set review and set ratings buttons should not be.

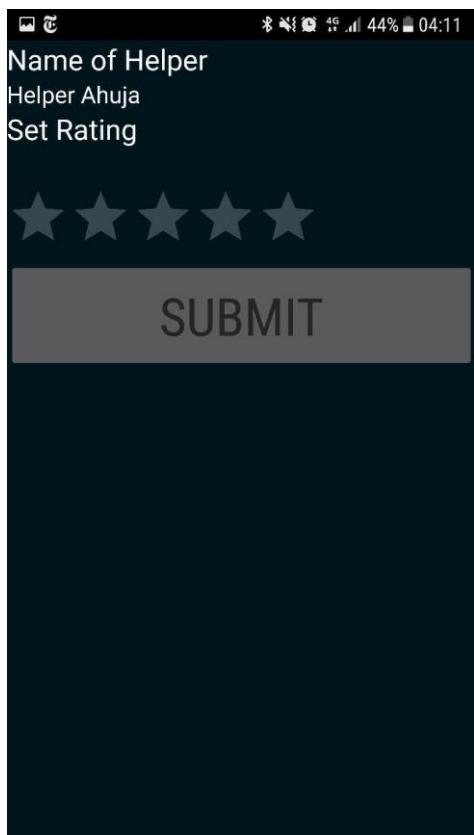

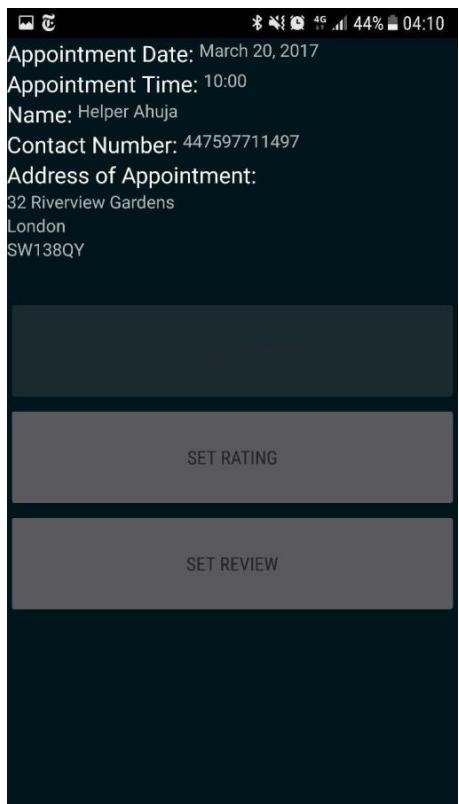

#### 4.6

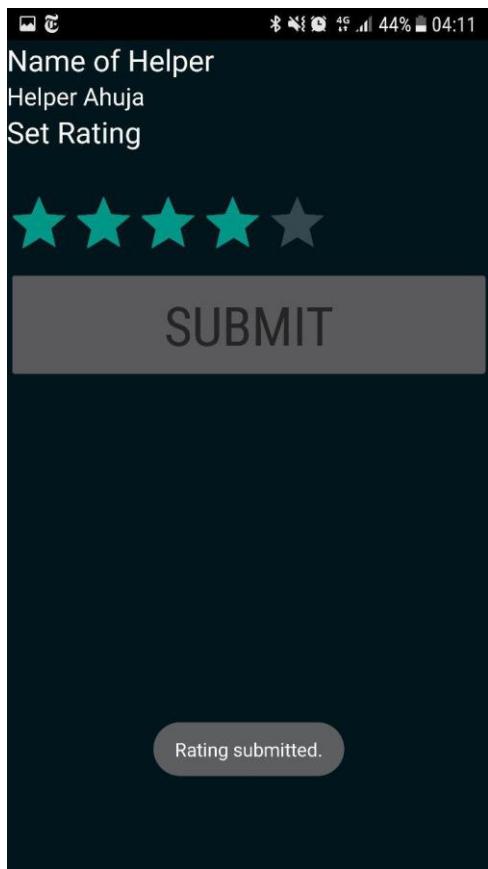

##### T4.6.1

**Start State:** Appointment details screen of a specific appointment.

##### Actions:

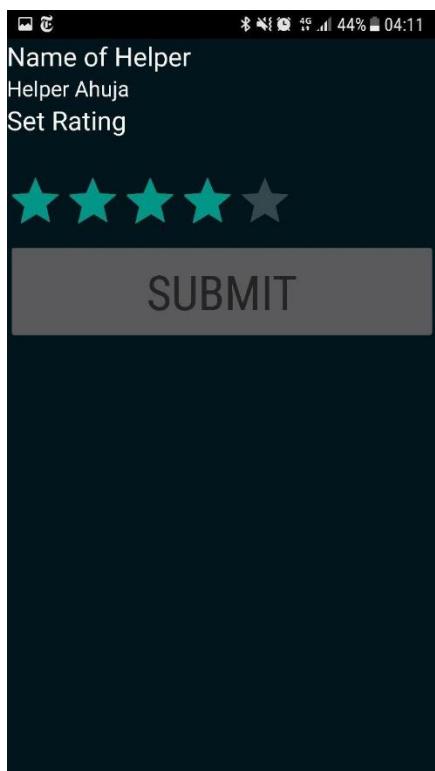

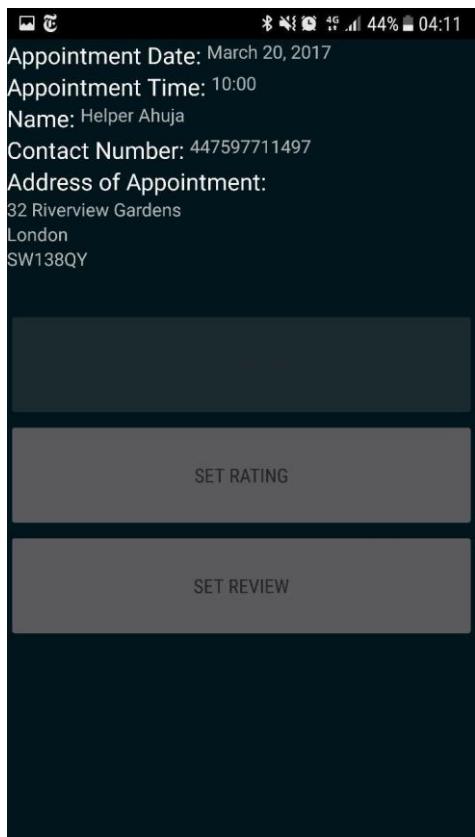

1. Click the Set Rating Button
2. Pick a rating in the ratings screen.
3. Click submit.
4. Press the back button to return to the list of appointments, before selecting the same appointment to return to the set appointment details screen.

#### E4.6.1

**Expected Result:** From the appointment details screen, the set rating button should be clicked again. The rating should now be populated with the rating which was set in the test, in this case 8/10.

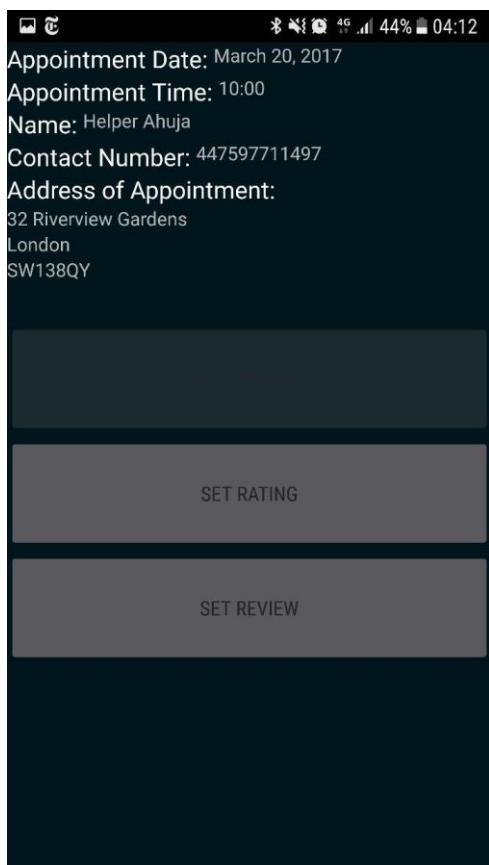

4.7

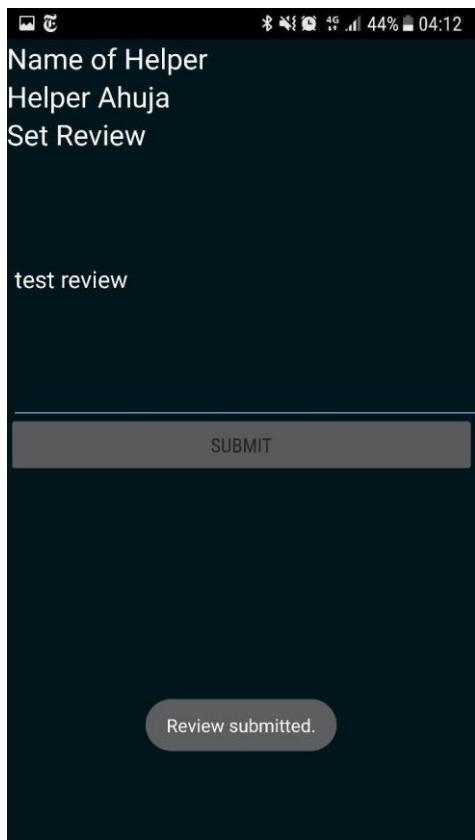

T4.7.1

**Start State:** Appointment details screen of a specific appointment.

**Actions:**

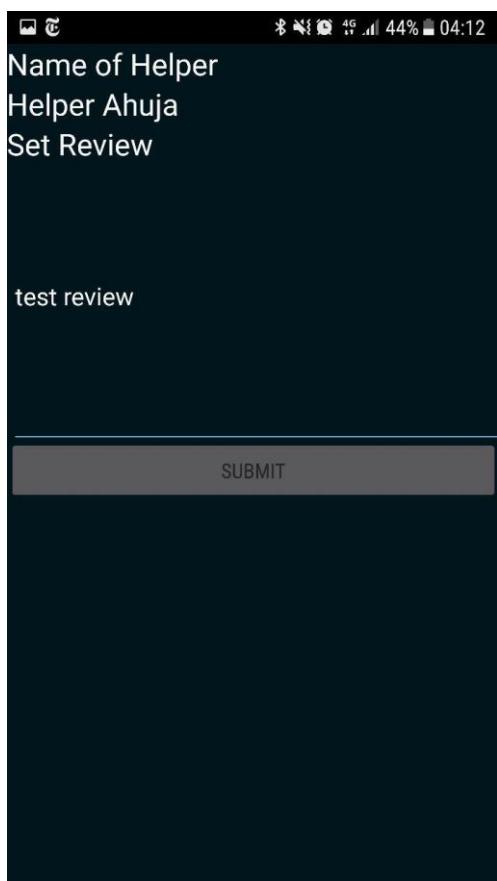

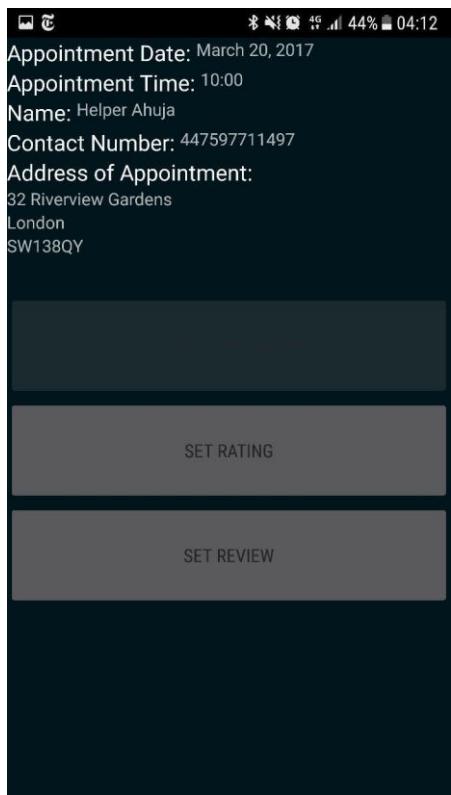

1. Click the Set Review Button
2. Write a review in the reviews screen.
3. Click submit.
4. Press the back button to return to the list of appointments, before selecting the same appointment to return to the set appointment details screen.

#### E4.7.1

**Expected Result:** From the appointment details screen, the set review button should be clicked again. The review should now be populated with the review which was set in the test, in this case "test review".

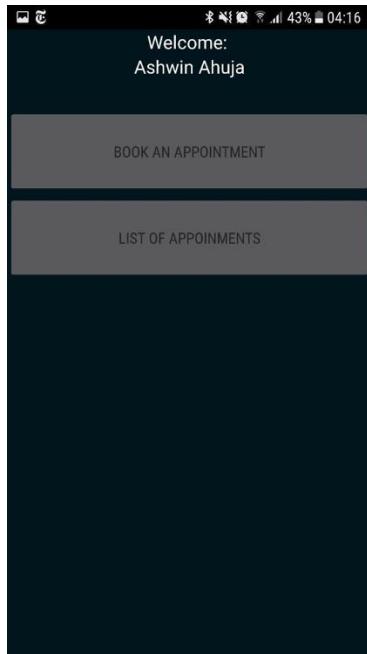

## 4.9

### T4.9.1

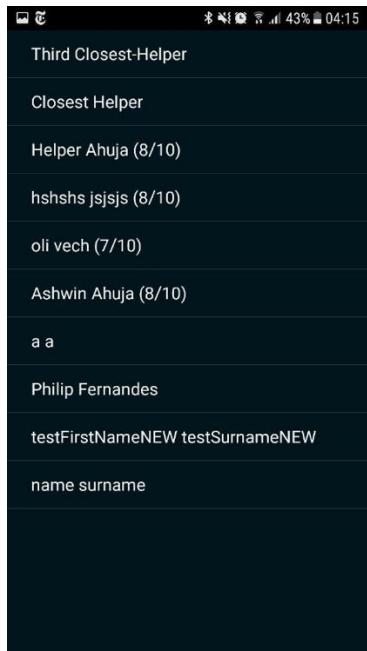

**Start State:** Logged into an elderly account registered with an invalid postcode on the welcome elderly screen.

**Actions:** Click the book an appointment button to get the list of helpers.

### E4.9.1

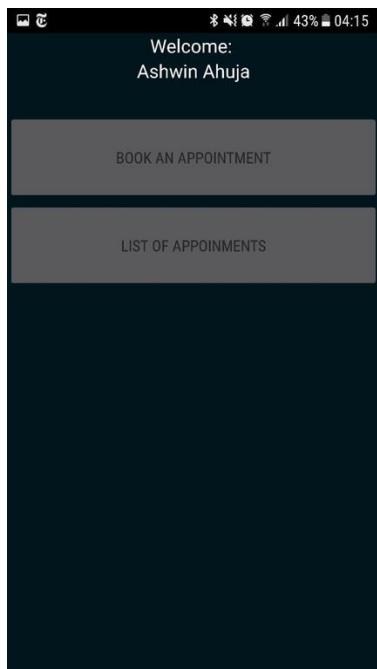

**Expected Result:** No error is thrown and instead all the helpers are shown in a list.

### T4.9.2

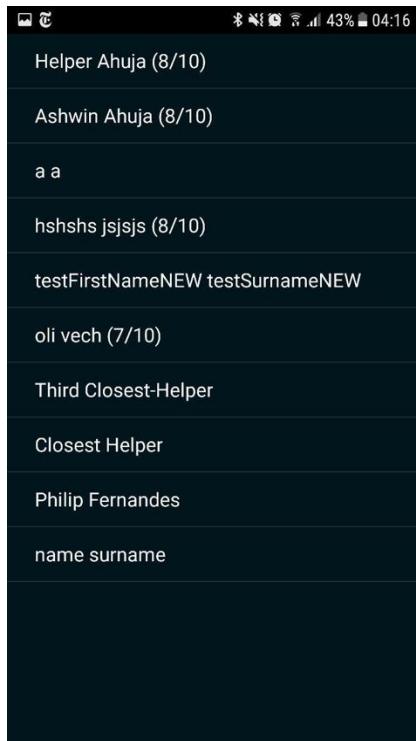

**Start State:** Logged into an elderly account registered with a valid postcode on the welcome elderly screen.

**Actions:** Click the book an appointment button to get the list of helpers.

#### E4.9.2

**Expected Result:** The helpers are displayed in the correct order, according to test 1.5.12, with the average rating correct (according to calculations based on test 1.8.1) where they have one.

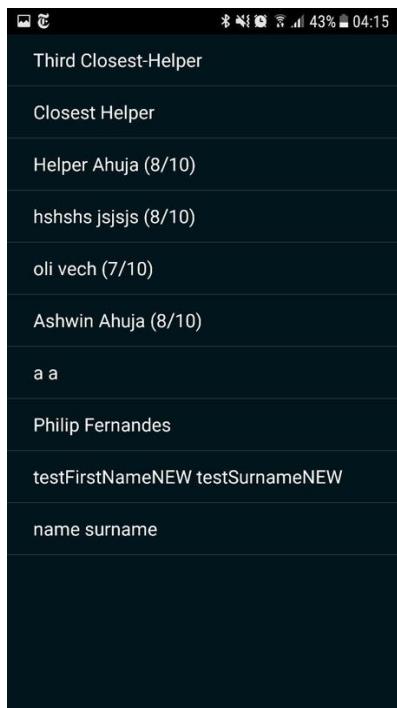

#### 4.10

##### T4.10.1

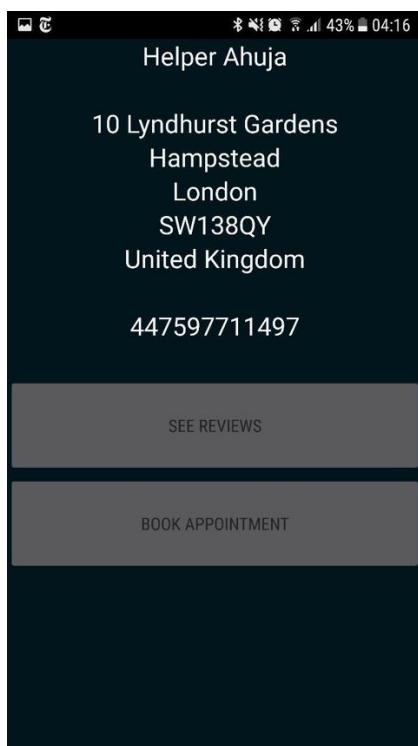

**Start State:** ListOfNearbyHelpers screen.

**Actions:** Click on a helper (in this case Helper Ahuja)

#### E4.10.1

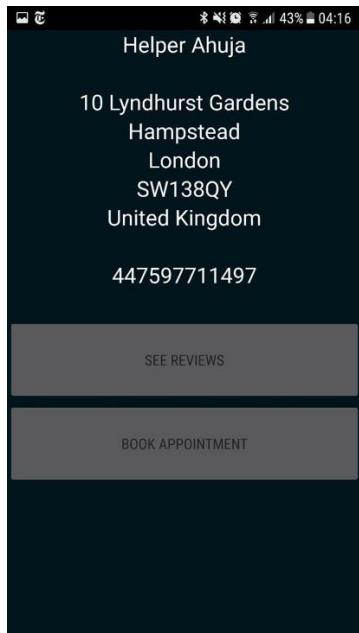

**Expected Result:** Check the helper details screen is successfully opened and has all the correct details according to test 1.5.2. Check the see reviews button is available if the user has reviews which exist, or is disabled if they have no reviews.

#### T4.10.2

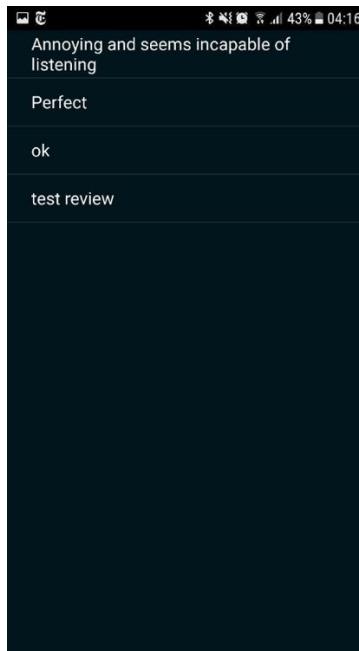

**Start State:** HelperDetails screen where the user has reviews which have been written about the helper.

**Actions:** Click the 'See Reviews' button.

#### E4.10.2

**Expected Result:** The screen should be populated with all the reviews of the helper, according to test 1.9.1.

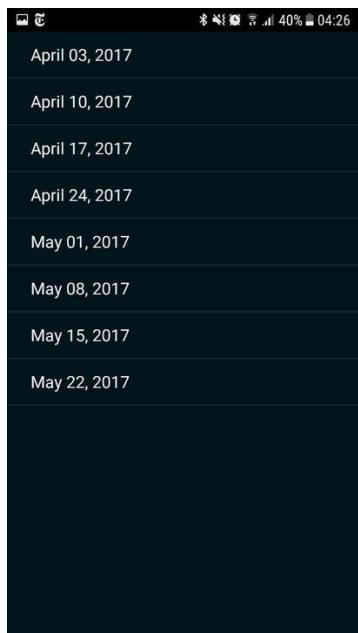

#### 4.11

##### T4.11.1

**Start State:** The weeks screen of any helper, having logged in as an elderly person.

**Actions:** Select the current week.

#### E4.11.1

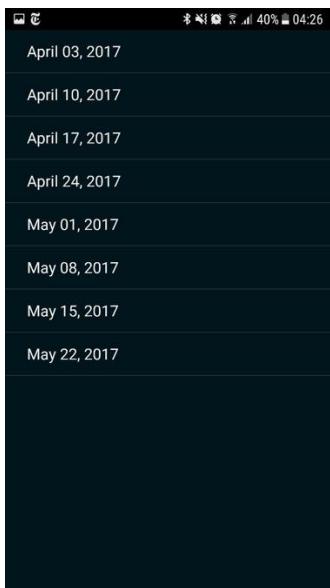

**Expected Result:** No days before the day of testing are listed as available to click to select an appointment.

#### T4.11.2

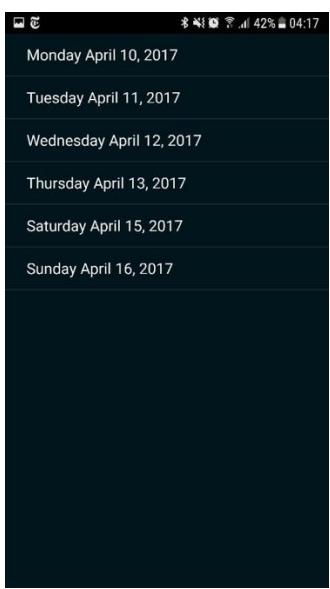

**Start State:** First, on a helper account, set a day as being completely busy, therefore having no timeslots free. Then, on an elderly account, attempt to book an appointment with this helper – selecting the correct helper and then clicking the book appointment.

**Actions:** Click the correct week, for which the helper has at least one day entirely busy.

#### E4.11.2

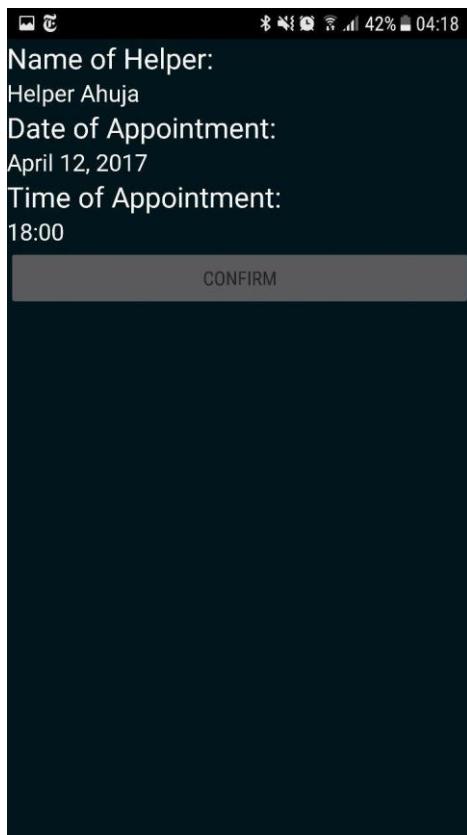

**Expected Result:** The day should not be listed among the days which can be clicked and an appointment be booked on the day.

#### T4.11.3

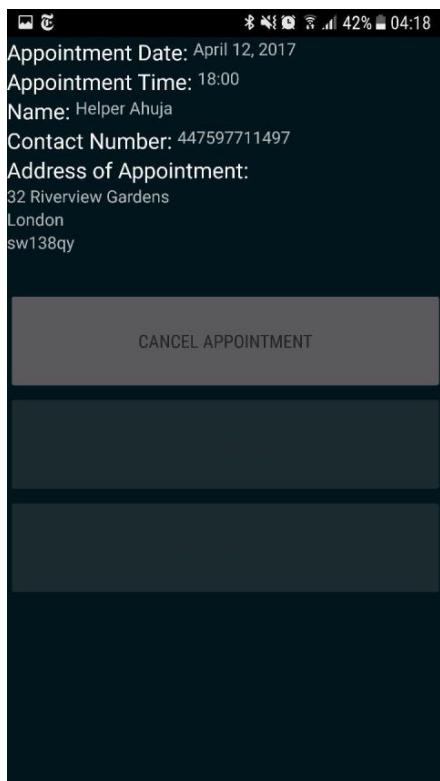

**Start State:** As a logged in elderly person, book an appointment with any helper and at any time, going to AppointmentDetailsConfirm screen.

**Actions:** Click the confirm button.

#### E4.11.3

**Expected Result:** After being taken to the listOfAppointments screen, the newly created appointment should show up on this screen and be able to be clicked, getting into the appointment details screen.

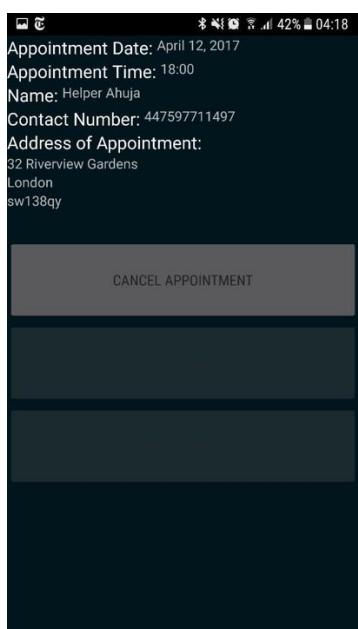

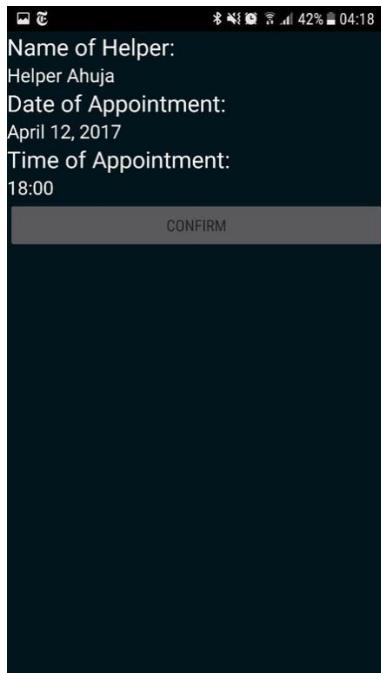

#### T4.11.4

**Start State:** In the same way as the previous test, an appointment should be created with any helper at any time.

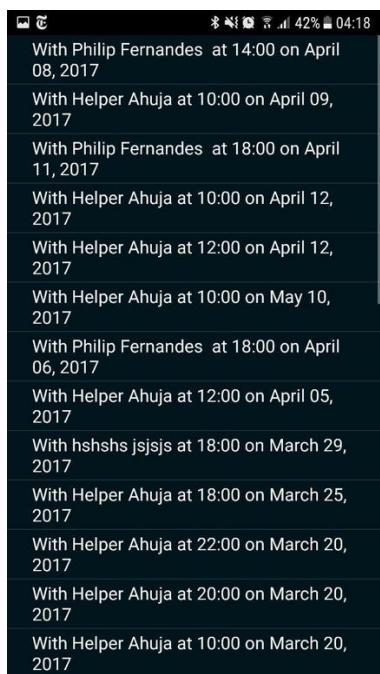

#### Actions:

1. The confirm button should be pressed.
2. On the list of appointments screen which appears, the newly created appointment should be selected.
3. Then, the cancel button should be pressed.

#### E4.11.4

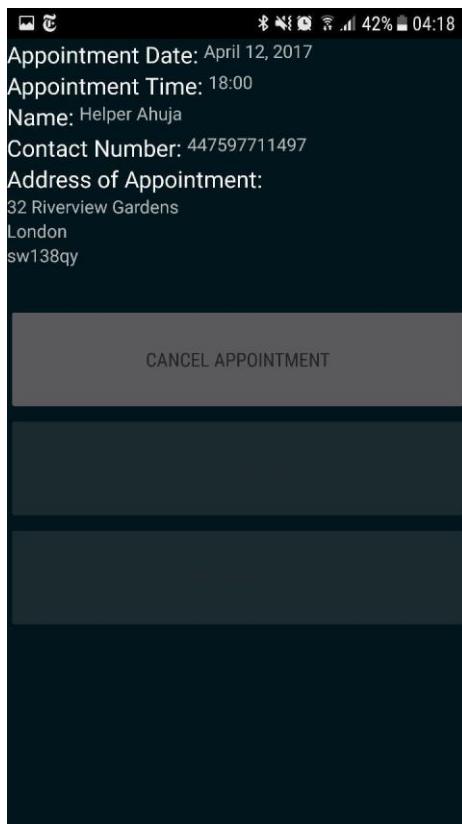

**Expected Result:** The list of appointments screen, once updated, should no longer show the appointment which was cancelled.

#### T4.11.5

**Start State:** Go to the list of appointments and select any appointment in the future.

**Actions:** Click the cancel appointment button.

#### E4.11.5

**Expected Result:** The list of appointments screen, once updated, should no longer show the appointment which was cancelled.

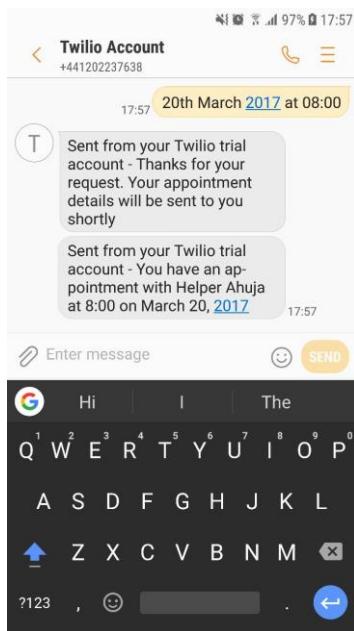

#### 4.13

T4.13.1 & E4.13.1

**Actions:** Send an SMS to the Twilio SMS number from a verified number when there is definitely time for the appointment wth a helper (for example by setting yourself as available using the nearest helper).

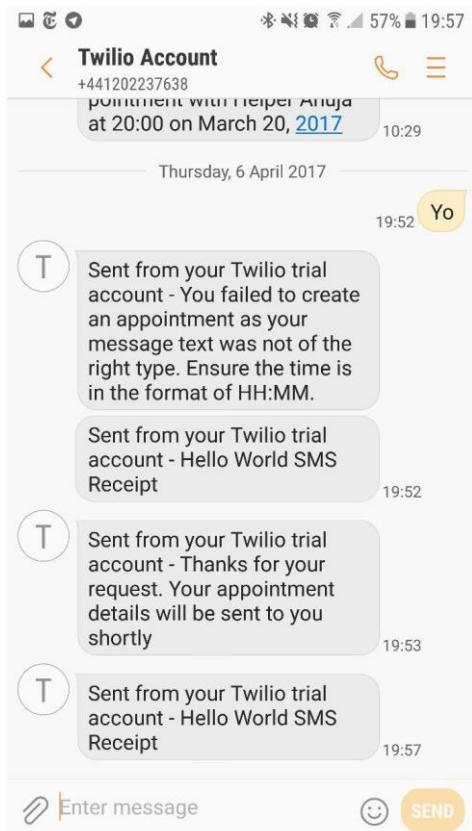

**Expected Result:** Message saying that an appointment has been created with the helpers name and the time that the appointment has been created.

#### T4.13.2 & E4.13.2

**Actions:** Send an SMS from a Twilio verified number with no valid date or time.

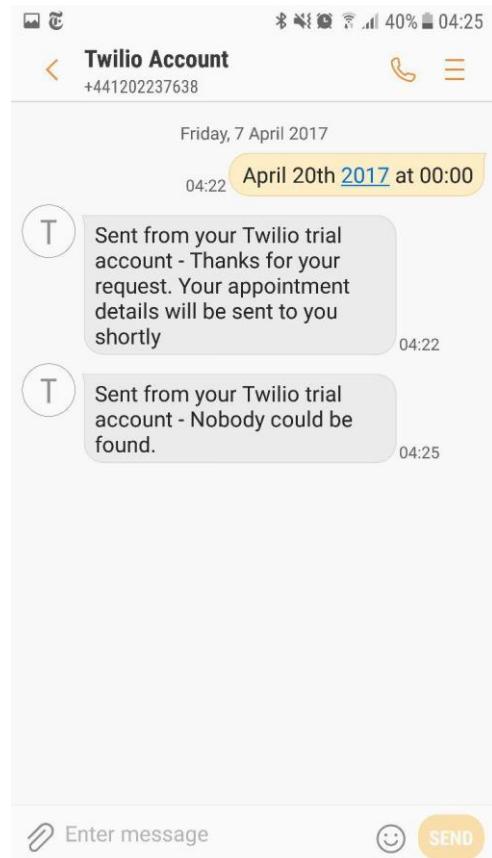

**Expected Result:** Text with the following text: "You failed to create an appointment as your message text was not of the right type. Ensure the time is in the format of HH:MM"

T4.13.3 & E4.13.3

**Actions:** Send an SMS to the Twilio from a verified number requesting an appointment at a time where no appointment is available – by going into the database and setting everyone as busy at this time.

**Expected Result:** Text response saying that “Nobody could be found”

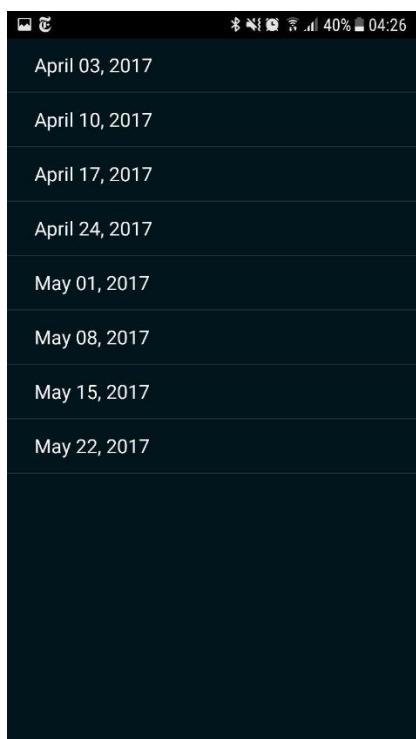

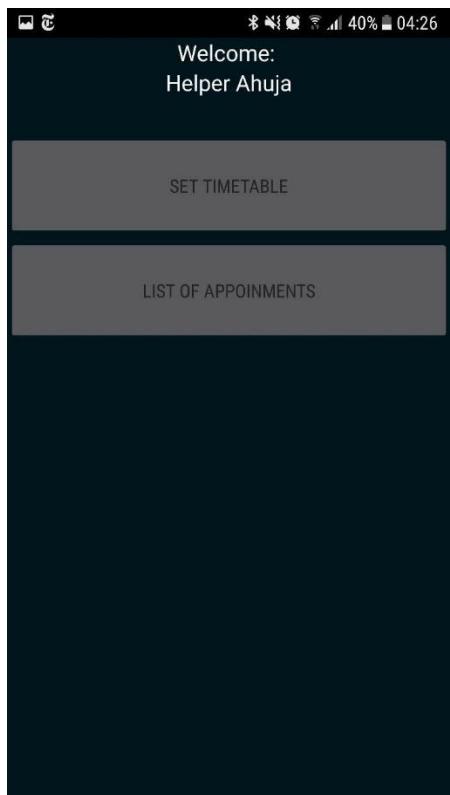

#### 4.14

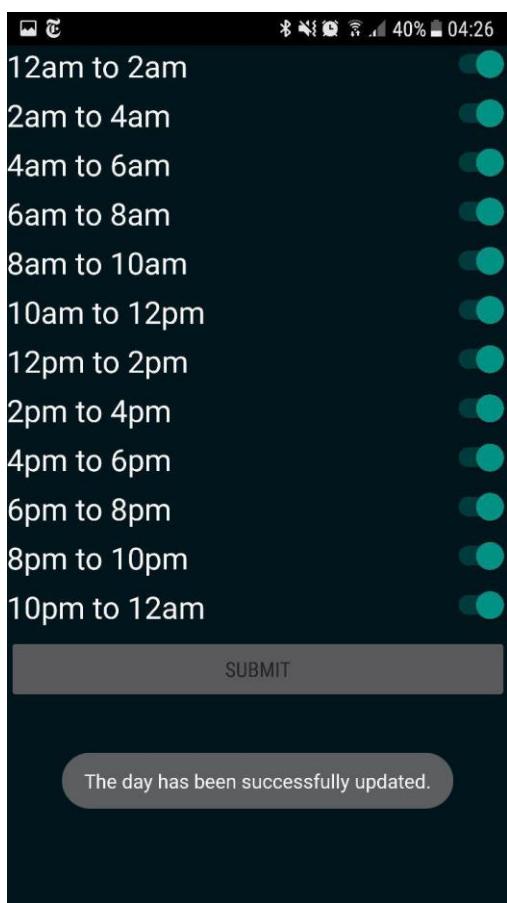

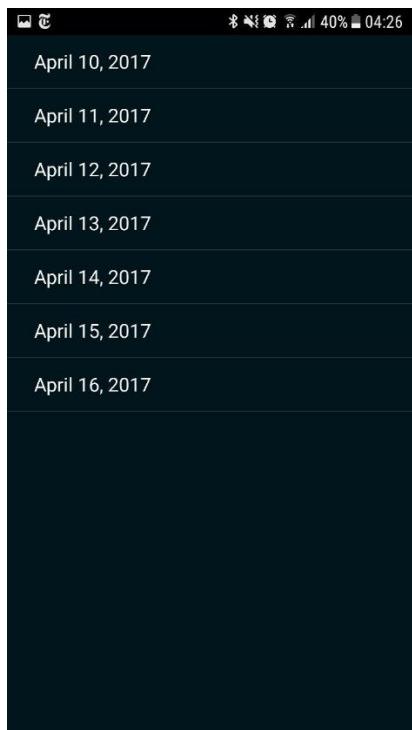

T4.14.1

**Start State:** Logged in as a helper.

**Actions:**

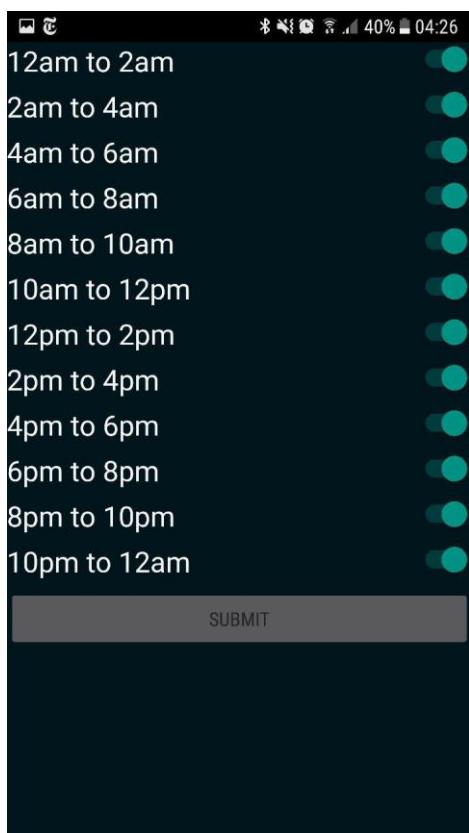

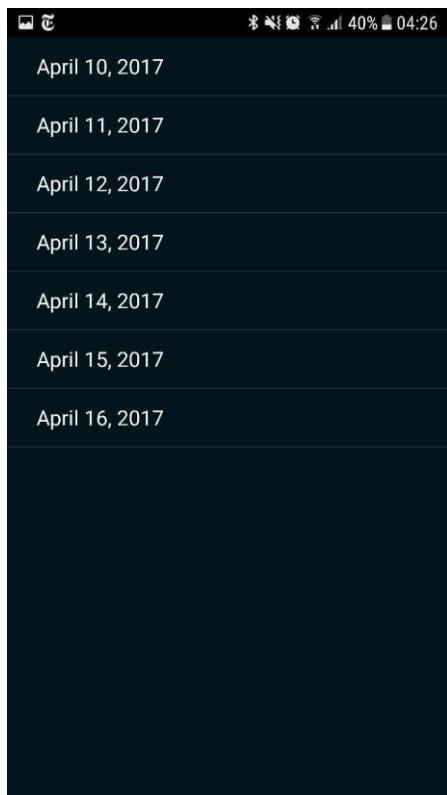

1. Click Set Timetable.
2. Pick a week and day.
3. Set a specific format of being free and record this.

#### E4.14.1

**Expected Result:** Go back into that day after closing the app and reopening it and check that the day has the same state as it was previously updated with.

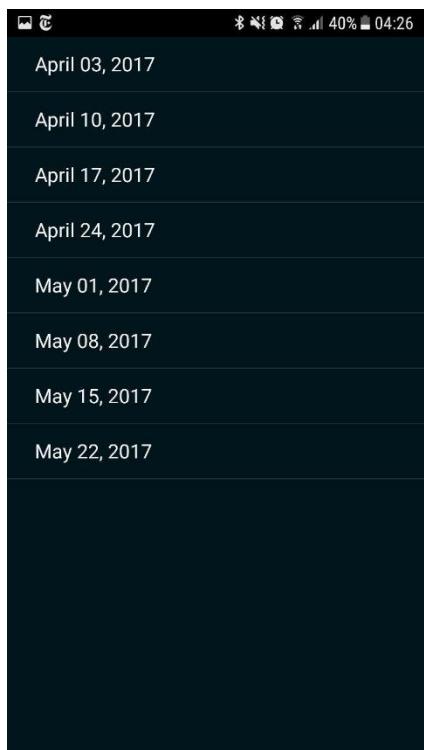

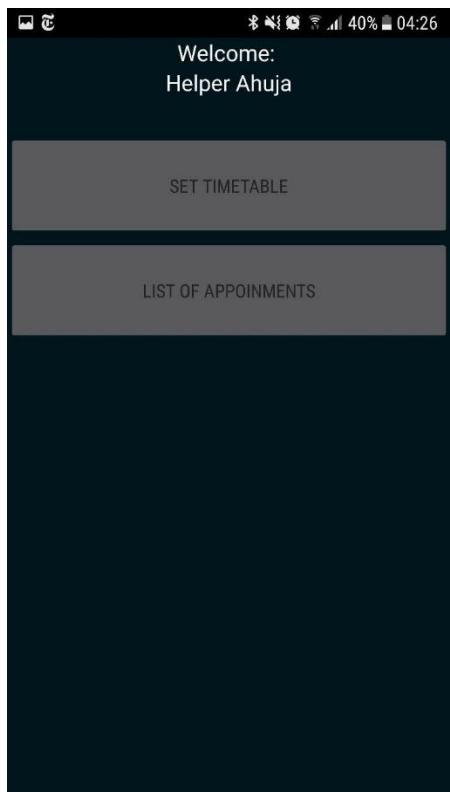

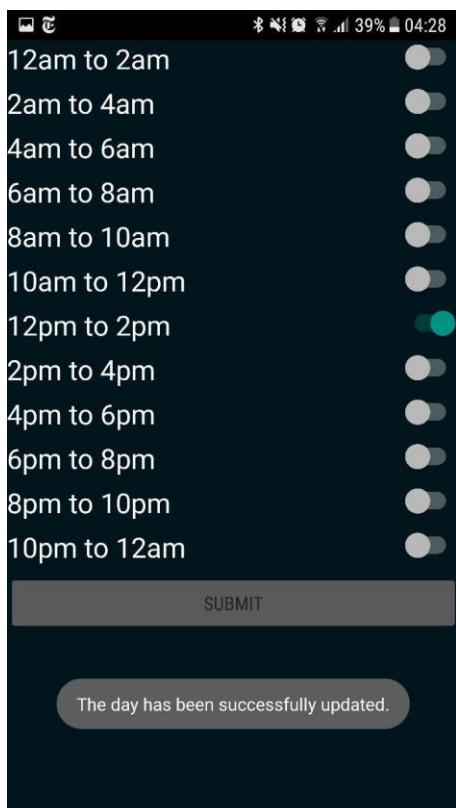

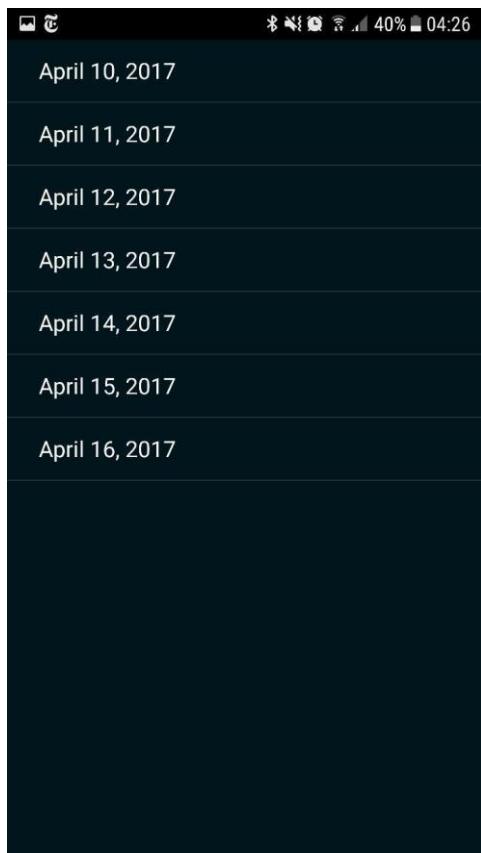

T4.14.2

**Start State:** Logged in as a helper.

**Actions:**

1. Click Set Timetable.
2. Pick a week and day.
3. Set a specific format of being free and record this.

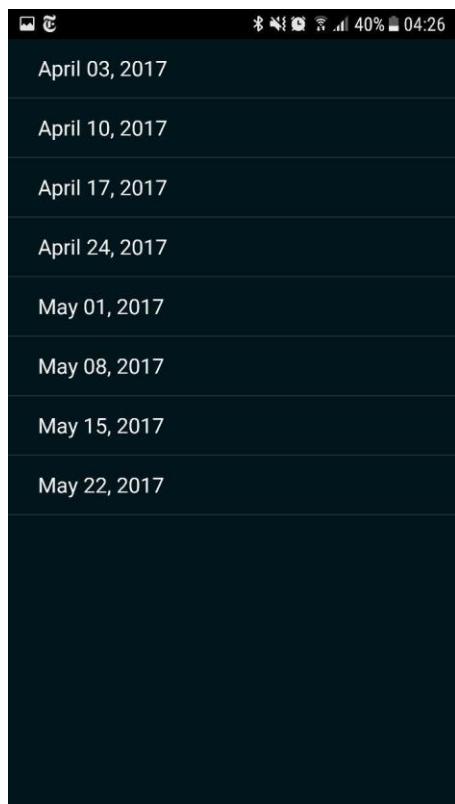

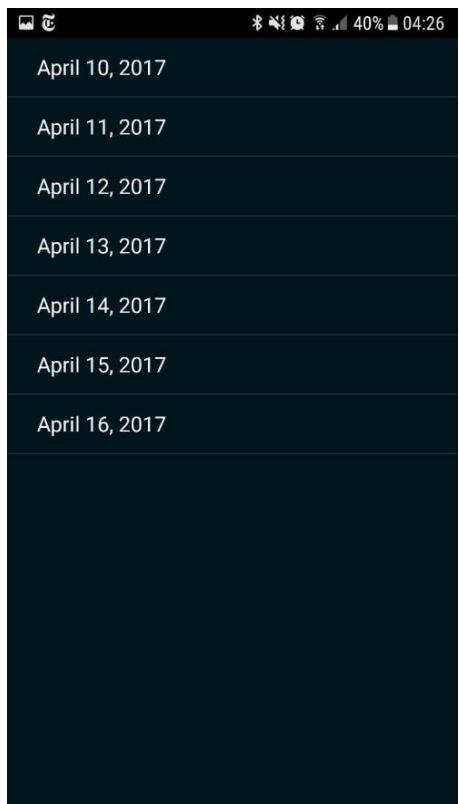

#### E4.14.2

**Expected Result:** Only be able to book an appointment at the times when the helper set themselves as being free.

**Actions:**

1. Log in as an elderly person.
2. Click book an appointment and select the same helper as for which the timetable was set. In this case, it is “Helper Ahuja”
3. Click book appointment.
4. Select the week and day for which the timetable was set.
5. Check the times which are available correspond to those set previously.
